5701. White Noise - All Frequencies and All Modes

Yahoo group: PCR1000
Date: 2011-04-01 02:08:28 UTC
From: sime3000
Topic: 5701 Message: 5701

Hello,

My PCR-1000 has developed a problem. I have nothing but white noise on all frequencies and all modes. The PC interface still works normally and I can adjust frequency, volume and any other setting.
I've heard of other PCR-1000's devloping this issue and I believe that the problem was reported to be failure of the diodes in the front end of this receiver. Does anyone have any experience with this issue and its repair ? i.e. Which diodes failed ? Where did you get replacements from? etc

Thanks in advance

Sam

5702. PCR Pro version 1.14.278 Now Available

Yahoo group: PCR1000
Date: 2011-04-20 20:14:03 UTC

PCR Pro version 1.14.278 Now Available for Downloading from homepage:
http://members.cox.net/fifty.50/PcrPro/PcrProDwnld.html

This update has Mine(9) Fixes, Four(4) Additions and Eight(8) Changes...

Apr 07,2011 - Fixed: Disabling Search Banks when Spectrum Sweep
Activated.
Apr 09,2011 - Added: Search Bank Editor for Dual Receiver.
Apr 10,2011 - Fixed: Loading/Saving Search Banks in Dual Receiver.
Apr 10,2011 - Fixed: Loading/Saving QuickChannels in Dual Receiver.
Apr 10,2011 - Fixed: Loading/Saving PriorityChans in Dual Receiver.
Apr 13,2011 - -----: Changed Memory Management of QuickChannels to
support Dual Receiver.
Apr 13,2011 - Added: Priority Channel Editor for Dual Receiver.
Apr 14,2011 - -----: Dual Receiver now has it's own Priority Channel
Settings.
Apr 14,2011 - Fixed: Setting the Quick Channel ToolTips in the Dual
Receiver.
Apr 16,2011 - Fixed: Displaying Correct Step Frequency when Selecting a
Quick Channel.
Apr 16,2011 - -----: When Selecting a Quick Channel, the Volume, Squelch
& I.F. Shift are Now Set according to the Volume/Master.
Apr 16,2011 - Added: Dual Channel Selector.
Apr 17,2011 - -----: If the Main Rcvr is set for Sweeping, then the Dual
Rcvr is too (If Active).
Apr 17,2011 - -----: LSB, USB, CW, DV and P25 Modes disabled in Dual
Receiver.
Apr 17,2011 - -----: 2.8 Khz Filter disabled in Dual Receiver.
Apr 17,2011 - Fixed: Loading/Saving Spectrum Sweep Settings in Dual
Receiver.
Apr 17,2011 - Fixed: Setting Volume in Dual Receiver when displayed.
Apr 18,2011 - Fixed: Spectrum Sweep in Dual Receiver.
Apr 18,2011 - -----: Lower Frequency Limit for Dual Receiver now Set to
50.0 mhz.
Apr 18,2011 - Added: Dual DTMF Setup Dialog.
Apr 19,2011 - -----: Removed VFO Search Buttons, They were Left Overs
from PcrPro1k.

Version 1.14.278 Released 04/20/2011

Jay

5703. PCR1000 compatible with MFJ-1278b multi-mode controller?

Yahoo group: PCR1000
Date: 2011-06-11 16:38:56 UTC
From: kukuruc
Topic: 5703 Message: 5703

Greetings all! Has anyone tried the PCR1000 connected to the MFJ-1278b multi-mode controller just for monitoring purpose?
If so, like to see which connections go to where?
Thanks all & 73's!
Tony

Thank you for your suggestion. Haven't tried it yet. Looks like I'll be connecting 2 laptops: one for the PCR-1000 for frequency/monitor control and the other lapop to the MFJ-1278b to see the sstv; rtty and anything else. Will be posting the results after I get a chance.

Topic: 5704 Message: 5707

Why two laptops?

Just use two com ports... The common USB<>RS232 devices will work fine, so one application to control the PCR, and one for the MFJ, but on the same PC.

Heck, depending what you want to do, there may even already be a custom app somewhere that'll do both anyway.

Or take a look at "Fldigi". If you have a powerfull PC, it'll probably handle more HF digi modes than the MFJ, just using the PC soundcard to take the audio from the PCR.

It also has rig control features built in too. The IC-PCR1000 is listed (still in beta) in the Hamlib setup tab under Rig Control. If that prooves to be buggy, it is posible to create your own driver file, as an XML file too.

Oh yes, The price is right. (Free)

http://www.w1hkj.com/Fldigi.html
Scroll down to the bottom for screen shots.

There are literally dozens of other radio-data decoding apps out there, for everything from CW to SSTV. The PCR could be good for that, with a good PC.

73.

Dave G0WBX.

5709. FS PCR-1000 with UT-106

Yahoo group: PCR1000
Date: 2011-06-21 22:33:06 UTC
From: ka8zty
Topic: 5709 Message: 5709

ICOM Computer controlled receiver- 10 khz to 1300 mhz coverage AM/USB/LSB/CW WFM/NFM. Includes UT-106 DSP, power supply, manual, whip antenna and original box. This is an early model with full frequency coverage. Good physical and electrical condition with a few scratches here and there, tested and working fine but its used electronics and sold as is. $300 + $15 shipping, paypal ok if buyer pays fees. 73 George

5712. Help on HF Tuning offset.

Yahoo group: PCR1000
Date: 2011-07-18 08:24:43 UTC
From: Paul D
Topic: 5712 Message: 5712

Hello

First time here, but wanting some help with my PCR1000

I am finding that all the AM FM modes are absolutly fine, however when I tune in an HF fequency Like 5505 usb 3k or 6k I have to tune it into 550515 to get it sounding it's best. It is also the same on 5649 etc. I have to offset it for clear reception.

I have tried Alligning software, but no avail. I would be very grateful of anyone could help me out here. I have had a few 1000's in the past, but this is the only one that is causing me greef.

Thanks is advanced..

/Paul D

Hi Paul,

If the main crystal is drifting from age, you can adjust the Crystal Reference in the alignment software to counteract the problem...

When I bought mine used in 2001, it had the same problem, but after I adjusted the Crystal Reference it came in fine...

Hi Paul,

From IComs' alignment program, click the [XTAL] Tab in the Adjustment Panel, you can click the Up/Down Button to change it...

I wouldn't use my EEprom settings in another 1000 since I have made a few adjustments and may de-tune your 1000...

I think there are eeprom files in the file section of this group. But if your crystal has drifted, they won't be of much help...

Topic: 5717 Message: 5717

Folks:
I have faced the following problem:
I had 633 entries in the WCF file.
Today I wanted to work with it and discovered that WCF file turned into 0.
All the WAV files are at their places, but WCF doesn't see and show them.
I'm very upset about that as I had about 600 receptions there which I planned to report to the stations.
Without the WCF file I can't learn the frequency and the day of the reception.
Please give me your advice.
Thanks in advance.
Andy

5720. PCR-1000 used to work, now randomly shuts down

Yahoo group: PCR1000
Date: 2011-08-28 07:55:23 UTC
From: w6dtw
Topic: 5720 Message: 5720

I have a PCR1000 with the DSP module which used to work fine. It sat in a box for a few years and now I find that it randomly shuts down. It works fine for half a minute to a couple of minutes, then it hear the shutdown "thump" from the speaker and I have to cycle the software power button to get it back.

Any have any experience with symptoms like this? I've tried using a different serial port, but no luck.

Check your power supply - especially if a wall-wart.
I'd look for 12 to 14 volts with no ripple.

You could also substitute the serial cable.
(My serial port settings are 9600, Data bits 8, Parity none, Stop bits 1, Flow control none)

Regards,

Fred.

The sympton is typical for when the serial port doesn't keep DTR high, or if it was CTS. Anyhow, it is probably due to lack of hardware handshake in the serial port.

Is it the same PC and OS install that you used a few years back, probably not?
But the control software for the PCR1000 is probably the same and the software should control the DTR
but now the computer hardware or the OS wont let it do that.

If there are jumpers on the PC mainboard, or a seperate serial card, check that they are set to handle hardware handshake. I had some similar problems when trying to use Win/NT and it could be that you are now using Win7 but the software isn't compatible with that OS.

I forgot to mention my PCR1000 is connected via a Profilic USB-Serial adapter on COM4 (9600,8,none,1,none).

Might it be that the original Icom software has been installed?

If so, install Revision 2.2 which is stable with XP (and reportedly Windows 7 too).

I much prefer Ham Radio Deluxe!

:-)

From: Dave
Topic: 5720 Message: 5724

Hi.

Check that the OS isn't monitoring the port, and powering it down after 'x'seconds no use. (Check in the PC's Power saving settings.)

Make sure you have the latest Prolific drivers for your OS. You can freely get them from Prolific's website.

There are some generic drivers that will work Prolific hardware, but do not support all their features, such as the handshake lines.

Make sure too, that your adapter, has true hardware handshake pins, that work! The chip and driver might do it, but not all gadget makers that use those chipsets implement all features.

Lastly, check the actual serial line voltages you're getting. Use a DMM, the pinouts can be found on many websites. Most of the well built USB<>RS232 adapters, will provide +-9V or so, on the data TX, and Handshake source lines.

Many of the cheap ones, only do +5 and 0!

I've used my PCR1000, with both FTDI and Prolific chipped devices, with Win2k, XP and Vista, with no problems. My adapters will also provide enough current to run RS232<>Fiber interfaces too!

Lastly, Ham Radio Deluxe, is a dream to use with the PCR radios. Well worth finding and downloading (free).

Hope something helps.

Cheers.

Dave G0WBX.

Thanks to everyone who responded and offered suggestions. I did some more testing and found that the problem is either the DB9 extension cable or a noisy wall wart. Using my marine battery backup and connecting the USB-Serial dongle directly to the PCR-1000 I was able to observe the receiver working for a couple of days with no glitching. I'm going to swap in the wall wart and see if that causes the problem to re-occur.

Best,

If you have found reason to suspect the wall wart, the LAST thing you do is swap it back in!
That's just tempting fate and FUBAR.

First prove it cleanly and reliably supplies the correct voltage on load.

You may also be surprised by how high the voltage when the receiver is on standby.

Invest in better if you have even the slightest doubt.

Stable, reliable, correctly rated power supplies are the crucial foundation to ALL equipment and what some manufacturers provide with otherwise excellent gear beggers belief!

Dave:

Look at PcrMC (PCR Monitor & Control) in the files section . . . I wrote it a very long time ago. It was originally written to run under MS-DOS, but it runs just fine in a DOS box (command prompt, either windowed or full-screen). Even though it wasn't written to be "pretty", I think you'll like the features. PcrMC-SA was written to run in 800x600 graphics mode, so it will only run in full-screen mode. Both will still work under Vista, XP, & Win7 32-bit, but not Win7 64-bit.

Good luck & have fun !!

just bought a 2nd hand PCR1000, but the only software that i can get to work with it proper is HDR.

TalkPCR works for about 10 seconds then stops, all other progs just refuse to talk to it.

Ive tried most software on both vista and xp.

Im using a USB to com lead.

Any suggestions on software, ive tried most of the 1's in the groups files area.

Thanks

Dave

The PCR1000EXP program in the files settion is the earlier December 2002 version.
Install the latest Version 2.2 software which is dated 2004/06/22

You can download it via the Icom America site where for PCR1000-Control Software you'll be directed to -

http://www.icom.co.jp/world/support/download/firm/index.html

http://www.icomamerica.com/en/downloads/Default.aspx?Category=122

If that does not run correctly something about your USB to Com lead, the drivers or your Com port settings needs attending to.
XP Device Manager identifies mine as Profilic USB Serial-to-Com Port and the settings are 9600, Data bits 8, Parity none, Stop bits 1, Flow control none.
USB Root Hub settings - Power Management might be worth checking too.

Also check your power supply.
Some including "Wall warts" give too high a voltage causing the PCR1000 casing to become noticeably hot and spates of intermittent operation.

Fred.

Hi Dave,
I was suffering same problem too. Prolific chipset based USB to RS232 converters with wrong drivers can cause this problem. I changed my USB to RS232 converter with a FTDI chipset converter. I have no problem with my new converter now.
You may have a look for alternative software (http://www.pcranywhere.com/) but it is not public now. I think it will be public in near feature.

Ham Radio Deluxe!
http://www.ham-radio-deluxe.com/

The definitive rig control program, could almost have been made specifically for the PCR1000, it works very well indeed, Windows 2000 or later, and with USB<>RS232 devices to get to the PCR.

Hello to you all,

I bought one PCR1000 but it looks like teaf in vhf/uhf. I suspect either
the entry is dead or a software problem.

Does anyone knows this problem ?

Best regards to all from Britany (France)

"Deaf" is relative.

Compared to a dedicated VHF rig, they are a bit deaf. (In common with many other broad band "scanner" type receivers.) They are slso somewhat more noisy, that also makes them appear deaf.

Unless you can measure it's performanc with a good signal generator, plus fixed attenuators and some means of measuring the recovered audio etc, or SINAD test set, it's difficult exactly to tell.

Check your software settings, just in case. RF gain, Squelch and so on.

If it just cant hear something, that using the same antenna on a good radio shows up as S9+, then you have a faulty PCR.

Regards.

Dave G0WBX.

Hi Dave,

You can give PCR Pro or TrunkPCR a try from here:
"http://members.cox.net/fiftyone.50/IComPcr.html"

Some USB to Serial converters do not utilize the CTS line, that some
software rely on to determine if a PCR is actually connected to a COM
Port...

PCR Pro and TrunkPCR has an option to "Ignore the CTS Line" status to remedy
this fault :)

Regards,
Jay

hello to all,

I bought I bought PCR-1000 Signal Capture and Analysis v1.13

It does not work on win xp pro, I have a runtime error. i tried many options, no success. grrrrrrrrr

With HRD no problem, it works, but seems deaf in UHF/VHF as explained to Dave.

A shame as I plan to use it for experiences with the graves radar

Box only, without electronics, with panel with all holes and Policabon Panel as in the demo:
cost is 40 euro+ shipping (10 euro in Europe, 20 euro in USA, 25 Euro Australia / New Zeland). Shipping cost is also for full KIT materials
I remember full Kit cost is 140 euro (no soldering required)

5761. Anyone Help?

Yahoo group: PCR1000
Date: 2011-11-16 19:31:49 UTC
From: Anthony R Gargano
Topic: 5761 Message: 5761

Hi Guys,
Used to belong to the old qth.net group and recently dusted off my PCR-1000 after a number of years of non-use.

I have a copy of the V1.31 Icom software and installed it on 2 different Win XP PC's. In both cases the software runs fine but when I try to communicate with the PCR1000 I get a General Protection Fault in OLE2DISP.DLL error message. Can anyone shed any light on this? Any suggestions for what I need to do to correct this to get the PCR1000 running? I searched the message archives but to no avail.

I would really appreciate any help anyone can offer.
Thanks Tony

Thanks Jay. That did it! Works fine now!

I also tried it with an old original Keyspan USB-serial converter tied to a netbook. I was surprised, that worked too! Anyone if there are performance differences between the early 1st generation USB-serial converters vs today's technology?

Laslty, anyone aware of Mac control software that will run on OSX without having to run a Win virtual machine?

Thanks, Tony.

I kept a note that PDQCOMM.VB was among files giving major problems with Version 1.31. The latest version (Revision 2) is similar but works well with XP and can be downloaded from the Icom site but it's a bit stagnant by now. For ease and capability I far prefer Ham Radio Deluxe which is evolving freeware

Hi...

As Fred said, HRD is about the best tool to run a PCR from, on Windows (Win2000 and later.) Awsome!

Older USB<>RS232 devices, the hardware is probably more reliable (no lead free rubbish to grow whiskers and die suddenly) but the early drivers can be a bit iffy with some vendors. Look for updates, or if it's a generic chip inside (FTDI or Prolific) just get the latest generic drivers from the relevant site. (Windows Device Mangler should show what's in use.)

No idea of any MAC software for PCR's or other ham needs, but if there is, get it installed quick, as it appears Apple want to lock down the Mac environment so only apps that work correctly in one of their sandbox's will be allowed. From about March 2012 from a recent news item.

I know there is stuff for 'Nix, but no experience of that. Other than some meddling with the Hamlib library etc. And good though that is for proven rig's, I don't know what the status is in detail for the PCR.

Have Fun.

Dave G0WBX.

Brian (& anyone else looking for a USB-to-serial adapter that works !!):

Here's a repost of a message (with links updated to be current) that I have sent out in the past regarding a highly recommended (from my personal experience) USB-to-serial adapter:

TT3/TT4 Groups:

Here's a product that I personally own & highly recommend for anyone that does not have a native serial port: Parallax (a well-known hobby company supporting all kinds of uP development support products & peripherals) offers a USB-to-serial adapter that works fabulously (I use it specifically under Win7, WinXP, Win2K, WinME, & RedHat linux). It also has the unique feature that it supports handshake signals (DTR for sure), as well as being USB 2.0 compatible. It is available in two flavors:

1) adapter only (no cable) for $14.99, stock #28030
    at
<http://www.parallax.com/Store/Accessories/CablesConverters/tabid/166/CategoryID/40/List/0/Level/a/ProductID/378/Default.aspx>

2) adapter plus 6 foot type A-to-mini B cable for $17.99, stock #28031
    at
<http://www.parallax.com/Store/Accessories/CablesConverters/tabid/166/CategoryID/40/List/0/Level/a/ProductID/379/Default.aspx>

The drivers for these adapters are available for download from the Parallax website at

<http://www.parallax.com/ProductInfo/Accessories/FTDIUSBDrivers/tabid/530/Default.aspx>

I use it for all kinds of things on both my desktop & my laptops (HP, Gateway, Compaq, & Dell) & have NEVER had any trouble with it in any way. It might appear more expensive than your average USB-to-serial adapter, but when you consider the number of messages on the Yahoo Groups regarding "I just bought the XXXX USB-to-serial adapter & I can't get it to work . . . HELP . . . ", this is a product that is well worth the price in quality & reliability !!

Disclaimer: I have no connection to Parallax, other than the fact that I have bought MANY of their products (read that as having sent LOTS of well spent $$$ to them !!), & have integrated many of the items that they sell (both uP's & peripherals) in a large number of my hobby projects, and that I am a happy & continuing customer of theirs.

To keep this on-topic, I have personally used this USB-to-serial adapter extensively for programming my PocketTracker, my TT3s, & both of my TT4 beta units. As another example, I have also used it in combination with my simple

CI-V cable to control my IC-756PRO, IC-7000, IC-706MKIIG, IC-R10, IC-W32A, & IC-T81, each using HRD, and I regularly use it to control my two PCR-1000 receivers.

Hi Brian,
It is the old original Keyspan, model number USA-19, with no suffixes ala the later models that came after it. I believe Keysapn is long gone.

When I was doing some research in this area I saw several favorable comments on the IO Gear GUC232A which you can find on Amazon for under $20.
Regards, Tony

5773. A Beginner With Questions

Yahoo group: PCR1000
Date: 2011-11-17 23:30:19 UTC
From: GMR
Topic: 5773 Message: 5773

I just received a PCR-1000 and I have almost no idea what I am doing. So where should a beginner get started? I have read some of the directions for the 1000 and looked at the help on the software, but I am still lost. I am running IC-PCR1000 software on a laptop under windows 98. I also have TalkPCR. I have the PCR-1000 up and running and I can enter some scanner frequencies (VHF scanner stuff) that I know, but I would like to be able to enter 13927 kHz and other frequencies in that range, but I have no idea how to do it. Of course I am assuming that the PCR-1000 receives this frequencies. All I can see to input are Mzh frequencies. I have done a lot of scanning with computers over the years, but this receiver is not much like a scanner.--Gary

From: Judson Ahern
Topic: 5773 Message: 5775

Gary,

Just divide frequency in kHz by 1000. So, 13927 kHz is 13.927 MHz, which is what you enter in the software. And your PCR1000 does tune to that. It receives almost "DC to daylight" :-)

5777. TrunkPCR version 0.90.281 Now Available

Yahoo group: PCR1000
Date: 2011-11-23 23:29:56 UTC
From: Jay
Topic: 5777 Message: 5777

TrunkPCR version 0.90.281 Now Available for Downloading from the NEW Homepage:
http://www.fiftyonefiftysystems.com/TrunkPcr/TrunkPcrDwnld.html

NOTE: Moto Type-I Support *should* be finished in the next major update.

This update has One Update and One Addition...

Sep 09,2011 - Added: RadioReference.com v9 update. When you see an item with a "T+", Right-Click on
the Item to Show the Related Trunking Site.
Nov 23,2011 - -----: Updated Homepage Links.

Version 0.90.281 Released 11/23/2011

IMPORTANT: If you have Upgraded ICom's Program to Version 2.20, then you will need to Check the [Ignore CTS] CheckBox in the COM Port Selector BEFORE Clicking the [Power] Button...

Regards,
Jay

From: Tony
Topic: 5789 Message: 5789

Hello,
I am using a PCR-1000 with TalkPCR 3.0 beta. Every time I start the software I get the following two messages

AM15.cal not found and WBFB50.cal not found

What are these files? Do I really need them, the radio seems to be working fine. It is just an annoyance to have to click the OK box on the screen each time the software starts up. Does anyone have any info on what is going on here?

Hi Tony - If you have a copy of TalkPCR2.4 and install that then the two files you want can be transferred from the install directory into the TalkPcr 3 directory. I have just done this as I had same problem and I can confirm it works.
Regards
Steve

5793. PCR AnyWhere ver 2.1 Released

Yahoo group: PCR1000
Date: 2011-12-28 13:28:12 UTC
From: ta3as
Topic: 5793 Message: 5793

Hi,

A new release of our software to manage Icom IC-PCR scanners has been delivered. This new version is PCR AnyWhere 2.1.

The software, release notes and the user manual are available for download at our web site http://pcranywhere.com.

We have fixed a lot of bugs that were found by the first users and we also added new functionalities to enhance the access control from remote locations and to improve the audio quality.

Don't forget to leave your comments in the forum available at the web site. Your opinion is very important for us.

Regards,

5794. Re: [PCR1000] PCR AnyWhere ver 2.1 Released

Nice...

I just had a play with a couple of the on-line radios (Spain and Canada) and have a comment or two. (Assuming they are using the new release, ignore if these have been fixed.)

The remote tuning is a "bit slow" (to say the least) and the graphic equalizer (bottom right) is odd too. The right most slider (8k) is not 8k, that is adjusted by the one marked 4k, from mk1 ear tests only. In fact, messing with that right most slider, makes a huge difference to the audio quality, it's not doing much in the frequency tayloring stakes.

Would it be possible (future update) to hover the mouse cursor over the frequency readout display, then use the mouse wheel to scroll that digit up/down as needed. That makes for both fast and fine tuning very easy.

Keypad frequency entry is good, but a visible hint to that on the front panel would be good to have (you also need "Numlock" on!)

The received and transferred audio sounds quite good, and is more than good enough for general monitoring. I don't have VAC on this box, plus the two RX's I tried, seem to have some severe QRM on 40m, so I didn't get to try any digi mode monitoring, PSK etc.

When I finish getting my main shack PC reasurected, I'll get the old IC-PCR1000 out, and get that hooked up and running again. Hmm.. HF antenna distribution improvement needed here too.

Anyway, well done sir's. Very nice.

Dave G0WBX.

5799. Re: [PCR1000] PCR AnyWhere ver 2.1 Released - Feedback

Yahoo group: PCR1000
Date: 2012-01-03 13:07:24 UTC
From: Fred
Topic: 5793 Message: 5799

Having noticed how very often PCRAnywhere is updated I thought to try to see if the most recent version might work with my PCR1000. Unfortunately the outcome was the same as with prior versions and similar to issues seen reported elsewhere.

Whether onboard serial or USB serial port - the receiver could briefly be heard active during configuration, the settings saved but the program would not function whatever was tried. Apart from an audible thump the power button stayed grey. The computer is a well maintained Dell 8400, runs Windows XP SP3 and every other program works well with the PCR1000.

This time I used "Revo Uninstaller" to remove PCRAnywhere and after its uninstall completed, Revo found

1,823 Registry Items and 96 leftover files and folders. These were deleted - a further 24 on next startup.

This is unfortunate and very unusual.
That I've now purged my main and portable computers of every last trace of PCRAnywhere makes it impossible for me to assist toward any resolution.

With regrets,

Fred.

5800. Re: PCR AnyWhere ver 2.1 Released - More Feedback

Yahoo group: PCR1000
Date: 2012-01-03 14:16:01 UTC
From: Dave
Topic: 5800 Message: 5800

Hi...

I also have just finished trying out PcrAnyWhere, with not a few issues.

Firstly, the setup program only seems to offer an automated hardware detect function, and no way (that I could find) for a user to tell the thing Com4 and Souncard2 for example.

So... During it's setup, it took an age messing with Com ports 1, 2 and 3 (tripping my UPS to go onto Battery at one point! That's on Com2) before it found the PCR. Also, leaving the UPS monitor program upset that it's link to the UPS had failed.

It then failed miserably, to find the associated soundcard, despite a full hard connection, after several minutes, playing with the PCR's filters etc, it decided to use one of the (unconnected) VAC "Soundards".

OK, so no sound for now...

I completed the rest of the setup, as a "Shared" implementation (the intention being to make it public) but my security software (Eset's Nod32 V5) threw a large hissy fit.

After I calmed that down (several hard Power Off reboots, as the PC locked up on three occasions.) I started to get some control back.

Why the dozen or more loopback TCP connections? No wonder Nod32 was having a fit (before I temporaralily disabled the firewall, not that it helped any...)

I can connect with a browser (FireFox 8.0.1) on the same PC to the PCR_AnyWhere page, but the Java applet that is "downloaed" hangs, needing another reboot, and just for the heck of it, I did a full Java update, I was on update 29, now 30. Sadly, no change.

I tried accessing the webpage from another PC with the same version of FireFox, that does work OK (if slow) with the on-line PCR's I've tried but that too hung, locking BOTH PC's!

So, is the problem souncard related, as I could not find any way to tell it with mk1 finger, what hardware was connected where.

Or, is it more insidious? Crashing Java Applets is not a good thing at any time, and some would say points to a gaping hole somewhere, that some nasty type might go looking to exploit for their own use.

For now, for my own remote use, I've uninstalled it all and gone back to IpSound (easy and quick to setup) and VNC for the control (overkill, but

it works) of the Icom software, all driven over a Hamachi VPN, very easy to get up and running, and so secure it squeaks. There is a version of IpSound, with a com-port remoting feature too, I'll play with that in good time, as it should work even better over a slow net connection.

I'd give you some screen dumps and error messages etc, but when they happen, I can't get anything off the PC as I have no control of it any more, other than pulling the power lead out! And whatever error messages there are, are unreachable, as their dialog is hidden under something else, that as the PC has locked, I can't do anything about.

All this, on XP SP3, all up-to date. One box running Eset's Nod32, the other MSE as the security/AV software.

Now to get one of my registry cleaning tools out perhaps, and see what got left in there.

Cheers.

Dave G0WBX.

I never installed this version after the total headache I had with 2.0, I could never get the radio to stay on but for a moment. After failing to correct the problem, the author just stopped emailing me so I deleted the program and used other more friendly and easier to install programs. I like many, was intrigued by the possibilities but it never worked for me so it did not matter. I am also running XP SP3 with a no issue computer.

Hi Dave,

Thank you for your feedback. I guess that you are not asking for support with the set up (you even don't tell us what receiver are you using), so I will not enter in technical details. Just a few comments:

1. My excuses to your UPS. It was not my intention.

2. To your question: "Or, is it more insidious?", my only and absolute answer is: "NO". The application may have serious installation problems in some environments but my only intention is to have fun during my free time and try to help other coleagues. As most part of you, I have a job and a family and I spend 100% of my free time developing what I and others consider interesting utilities, but I don't have time and interest on hacking your computers. I have enough computers to hack under my desk.

Take care,
..JC

Hi Bruce, it's nice to hear from you again.

As you can guess from other posts, version 2.1 still have the same problems with some PCR1000 than before, which I thought that I had corrected. That is a problem of not having one of those PCR1000 to test.

I have to thank you for your patiente with version 2.0 and I will advise you when I get a version running with PCR1000 under any circumstances.

By the way, I will forward you my email from 16/10/2011 at 17:45 (GMT+1) which seems that you didn't receive because you never replied to it.

Regards,
..JC

5805. Re: PCR AnyWhere ver 2.1 Released - Feedback

Yahoo group: PCR1000
Date: 2012-01-04 09:17:24 UTC
From: Juan Carlos
Topic: 5793 Message: 5805

Hi Fred,

Thank you for your feedback. Just a few comments from my side:

- PCR AnyWhere 2 had two releases with a delay of 3 months between them. If that is too much for you, sorry to disturb you.

- Yes, I am having problems with PCR1000. I am trying to fix them. As I only have one PCR1500 and I don't have the money to buy a PCR1000, that becomes more difficult. The PCR1000 with which I make my tests is 3000 km away from my home. I can tell you that my application works with some PCR1000 and it doesn't with others. You can see a working installation at PCR OnLine. With the help of the users, I hope to have a working version soon.

- That thing... "Revo Uninstaller" is showing you all the registry items and files from the Java Runtime Environment. That means that if you delete all the registry entries and files that it proposes, you wil be uninstalling your Java support. I guess that "Revo Uninstaller" doesn't behave well with a Java application.

This is what PCR AnyWhere touches on your computer when you install it:

Creates the following 3 registry entries:
HKLM\SYSTEM\CurrentControlSet\services\PCRAnyWhere
HKLM\SOFTWARE\Microsoft\Windows\CurrentVersion\Uninstall\PCR AnyWhere
HKLM\SOFTWARE\Microsoft\Windows\CurrentVersion\App Paths\PCR AnyWhere

Creates and populates the folder PCR AnyWhere under the installation folder that you selected.

Copies the file rxtxSerial.dll under jre\bin

Copies the file RXTXcomm.jar under jre\lib\ext

Nothing else. I hope that with this information, it will be easier for you to remove any trace of my application, but I recommend you that you don't unistall the Java Runtime Environment, even when "Revo Uninstaller" recommended it.

With regards,
..JC

From: Fred
Topic: 5793 Message: 5806

Hello Juan,

Looking back through the forums I see another program regularly updated and regret that I combined my impressions.
My feedback was intended to report my unsuccessful
repeated efforts with each release of an otherwise highly attractive
program.

Your comments reflect how determined user effort might affect the registry and other programs.

I've had no bad experience of "Revo Uninstaller" but in case the runtime environment should have been damaged I've used it to uninstall previous Java versions (as the Java website advises) then reinstalled Java 6 to Update 26.

Not having a PCR1000 to hand must be exasperating and I wish you successs in resolving the issue.
Regards,

Fred.

From: Dave
Topic: 5800 Message: 5807

The "PCR not staying on" problem is suprisingly common with many control programs. AFIK, it's usually to do with partial or incomplete implementaion of the serial port handshake lines, by the PC or USB<>RS232 adapter used.

Sometimes (rarely) a driver update fixes it, else it's use a good adapter instead of what you might be using.

I've not had that issue with "Real" com ports (when a full 9 pin cable is used) or with USB<>RS232 adapters based on the FTDI or Prolific chipsets, both of which (if built correctly) do the correct handshake line things.

But I have seen it, when I've used some home built cables, where not all the lines are passed through.

Best Regards.

Dave G0WBX.

Hi Juan Carlos.

Please accept my appologies if I came across as "getting at you" that was not the intention.

I fully appreciate the time and effort you put into this program, as I too also do some coding for my own ends, and sometimes for others, so I know it's difficult to cover all bases. I also know just how much time it takes to create even a simple program that works correctly, or dies gracefully if things go bad.

Re the RX I have, sorry for not listing it, but it's an original PCR1000, the UPS is an APC "SmartUPS" with the APCUPSD monitoring software installed on the PC, and hooked up to COM2. The PCR was on COM4, another radio (A Skanti TRP series) is on COM1, but not powered, I forget what's on COM3, but there is a cable on that too going somewhere....

I also have several VAC "Soundcards" (Virtual Audio Cable) used for piping audio from one application to another, mainly used with SDR programs, so as to be able to use digimode applications with them, as well as two physical soundcards, one on the motherboard (AC97 series) and an M-Audio PCI card. Plus, several other devices and tools that "pretend" to be other things, like Virtual Null Modems, and network re-directed COM ports!

Though an automated hardware/interface detection facility is good to have, it would be even better if there was an option to disable that before it goes off and does it's thing, so that if the user "does know" what hardware they have, they can then just tell the program to use for example, "COM4" and "Soundcard X" or whatever, so there would be no confusion. As you might imagine, it too the auto detection system "An age" to complete it's task, with no way to interupt it to tell it what I knew to be correct. Or alter what it thought it found when it had done.

Also, some more obvious documentation, as to the programs needs, in regards to it's networking system, so it can communicate between all it's internal modules (my best guess as to why there were a dozen or so live TCP connections listed in the "netstat -an" listing) when the program was running. Or, is that mainly the Tomcat server doing it's thing?

Either way, it'd be good to know in advance, so (again if the operator knows) we can temporarly disable our internal firewall's so as to evaluate the program.. With detailed info, we can (if needed) preset the firewall rules to accommodate it all, AND protect it from "external influences" etc.

I'll gladly look at PcrAnyWhere again, if you at some point release a version we can have more control of, in regards to what it uses hardware wise. There is certainly a lot of interest in this sort of remote useage.

Best Regards Juan Carlos.

Dave G0WBX.

------- Original Message -------
Hi Dave,

Thank you for your feedback. I guess that you are not asking for support with the set up (you even don't tell us what receiver are you using), so I will not enter in technical details. Just a few comments:

1. My excuses to your UPS. It was not my intention.

2. To your question: "Or, is it more insidious?", my only and absolute answer is: "NO". The application may have serious installation problems in some environments but my only intention is to have fun during my free time and try to help other coleagues. As most part of you, I have a job and a family and I spend 100% of my free time developing what I and others consider interesting utilities, but I don't have time and interest on hacking your computers. I have enough computers to hack under my desk.

Take care,
..JC

FYI.

Just about all the Tomcat webserver programs and tools, were left on disk, after the automated uninstall.

No "broken" registry entries, but I've not gone looking for any orphaned entries yet.

Yes, the program could be Sooooo usefull, but I'll await and see if any updates appear that might address all this.

As an alternative, look at the GlobalTuners project (google will find it.)

Regards.

Dave G0WBX.

Hi again,

I am already working on an option to manually setup the hardware. It doesn't look difficult. It will be released together with a better serial communications control for the PCR1000.

You may also set it up by manually editing the configuration file. You may get some information about that and also about the implementation of the protocol and other technical aspects of the application in the technical manual:

http://files.pcranywhere.com/2.1/PCRAnyWhere_2.1-TechMan-EN.pdf

Regards,
..JC

Also, it is well known that PCR1000 needs RTS and DTR lines up all the time to continue working. I guess that the way that I do that doesn't work all the times. I need to investigate that.

Thanks,
..JC

Yes - the mysteries of RS232 certainly can become complex and I agree about adapters, cables and ports!
I'd also choose a Profilic chipset USB-RS232 adapter if a "real" COM port isn't available.

With either, my PCR1000 with supplied cable works well with Icom's version 2.2 software, IcomControl 3.3, Ham Radio Deluxe, Mscan Meteo, Spectrum Analyser GM, Scancat Gold, TalkPCR and others not currently installed.

Default Com port settings are 9600, 8, None, 1 and no flow control.

It's also reliable with an old Palm VIIx PDA running the IP1kC-v1.2.1 program found in this forum's files section.
I use a null modem adapter (wired as 2 and 3 (TXD & RXD) crossed, 7 and 8 (RTS & CTS) crossed and ground = pin 5).

My receiver is one of the earlier ones and the supplied "Wall Wart" and warranty replacement caused overheating and intermittent operation due to excessive voltage. A stabilised 12V supply fully solved the problem.

Supplies and connections are always worth checking!

Regards,

Fred.

Hello Dave,

I just wanted to say that I am having the "not staying on" issue on an XP SP3 clean and fast computer with no other issues on which I have installed an RS-232 interface board with a straight-thru cable, no adapters. The interface and cable work on desktop radios such as my current R8B.

I really hope someone can come up with a solution to this problem, because this appears to be excellent software and I really would like to use it!

Best regards,

Topic: 5800 Message: 5814

Hi Ron.

Have you tried the genuine Icom (get the later V2.2) software? Even if you don't want to use in in the long term, it's probably best to try it first, if it works OK, then there is noting wrong with the PCR hardware, your PC, or serial link.

http://www.icom.co.jp/world/support/download/firm/IC-PCR1000/2_2/index.html

or http://preview.tinyurl.com/7wdpwml if the above got broken.

That is for the PCR1000, there is also a version for the PCR100, if you poke about. (Google is your friend etc.)

This V2.2 program, is a *HUGE* improvement on the orignal clunky version.

It's a 3 meg download, a zipfile of the installer and it's data files, much as you'd see on a companion CD. Unzip to a temporarly folder, and run the installer from there. If you are using Windows Vista or 7, then do not let it install to a folder in the "Program Files" structure, make it go to a sub-folder from the root, or some other easy to find place, "C:\MyHamStuff" for example. Vista and 7 protect the Program Files folders, preventing app's from writing to their own data files if they are stored there, as many older programs did, needing you to mess with the UAC, and that can cause problems in other ways...

Also, it's worth 'scoping or measuring the voltages on the serial port pins. Some I/O cards only use +-5V, not even +-12 (let alone +-24!)

Some laptops only use 0 and +5V too, but that's rare now. More of a problem, is the EMI filters on some ports, they have suprisingly high series resistance values fitted, that for anything other than high Z ports at the other end, will drop too much voltage, resulting in such "Not staying on" problems.

Check too, that your PC has the "No Serial Mice" option set. Google that to find out how. That can stop lots of odd things happening, after a reboot. Assuming you don't have a RS232 serial Mouse in use.

Most USB<>RS232 adapters I've come across, using either the Proliffic or FTDI chips, also use the Max232 (or clone) chip for the line drivers and receivers, so generate about +-8V. We use them at work, and they can power our RS232<>Fibre interfaces OK, so are OK for general Ham use too.

Make sure your "Straight Through" serial cable, is indeed such a thing. Some are only a partial implementation, with some pin's looped back at each end, OK for PC to PC work, but not for some hardware devices, such

as the PCR's etc.

If all else fails, you'll have to wire a custom cable, and assert the needed pins to the PCR from some other voltage source.

Best Regards.

Dave G0WBX.
(Been messing with serial com's hardware stuff for more years than I care to admit!)

It works well and reliably.

"It does what it says on the side of the tin."

With my IC-PCR1000 anyway.

OK, so the UI is a little clunky, but it does work, and as Icom created it (perhaps) for use with the PCR', it should be the first thing to use to check their hardware. If it can't work, then chances are other software will fail too as something is wrong with the hardware, or configuration of it, etc.

It's DTMF remote control applet is usefull to me too. Again, it works well.

5819. Beta testers needed for PCR AnyWhere

Yahoo group: PCR1000
Date: 2012-01-20 22:02:02 UTC
From: Juan Carlos
Topic: 5819 Message: 5819

Hi,

We request volunteers to test the new release of PCR AnyWhere 2.1.1 with full support for PCR1000 and PCR100 (apart from PCR1500 and PCR2500).

You will just need to contact us to receive the new beta version which you should test and feedback us with your comments. If new beta releases appear, you will also receive them until we get the final version.

If you are interested, please contact us at beta@...

Many thanks,
..JC

Homepage:
"http://www.fiftyonefiftysystems.com/TrunkPcr/TrunkPcrDwnld.html"

NOTE: Moto Type-I Support *should* be finished in the next major update.

This update has One Fix and Two Additions...

Jan 12,2012 - Added: Country Agencies in RadioReference Import.
Jan 18,2012 - Fixed: Editing Frequency in Main Display using keyboard.
Jan 20,2012 - Added: Freq Plan Calculator.

Version 0.90.282 Released 01/21/2012

The Frequency Plan Calculator is a tool to help you determine UnKnown
Frequency Plans.

Using the Frequency Plan Calculator.

1) Identify the Base Frequency:
a. Select the LCN that is associated with the Active Control Channel.
b. Enter the Correct Frequency of the Active Control Channel.
c. Adjust Offset and Step Rate if needed.
d. Click the [Calculate Base] Button.

2) Determine Voice Channel Frequencies:
a. Select the LCN that is associated with a Voice Channel.
b. If the Base, Offset and Step is correct, its correct Frequency will be
shown.
c. If Not, then be sure the Step Rate is correct and adjust the Offset.
d. Repeat steps 2a to 2c for the rest of the entries in the Frequency
Found List.

3) Extended Freq Plans:
These can be identified with different Base Frequencies and Offsets.

Normally, the Base Frequency will end in 0000 (ex: 406.0000).

When you have determined the correct Offset and Step Rate, you can click on
the
other entries in the Frequency Found List and it's corresponding Frequency
will
be calculated and shown in the Channel's Frequency textbox. If the
calculated
Frequency matches the correct Voice Channel Frequency, click the [Save
Entry]
Button.

If you discover that different clustered LCN's have a different Base
Frequency
and Offset, then this system would use the Extended Freq Plan.

Regards,
Jay

Hi Fred,

Yes, that is the plan :)
I have the structure of the messages already coded, still working on the DSP code to convert the sound into the correct packets for the Control Channel Information...

Since we now have a tool called DSD 4 Windows that another author compiled, that can be used to decode and play the voice data as long as you have a sound card that supports the 96000 hz sampling rate (most new ones do)...

Regards,
Jay

5824. PCR AnyWhere 2.1.1

Yahoo group: PCR1000
Date: 2012-01-30 17:50:39 UTC
From: Juan Carlos
Topic: 5824 Message: 5824

Hi,

PCR AnyWhere is releasing today the version 2.1.1 which is a maintenance release to fix the communications problems with some receivers of the type PCR1000 and PCR100. Apart from that, some other changes have been made like the option to manually set up the hardware or a drastic improvement on the time response of controls when the application is operated from a remote location.

The new version is available from the section 'Downloads' of our web page http://www.pcranywhere.com <http://www.pcranywhere.com/>

Your feedback is greatly appreciated.

Regards,

..JC

5825. Received signal measurement software needed. Newbie!

Yahoo group: PCR1000
Date: 2012-02-19 21:12:04 UTC
From: rfiemiguy
Topic: 5825 Message: 5825

I am looking into a PCR-1000 to capture some UHF FM signal strength data.

Specifically I want to create a continuous log file of manually created data sets.

In other words, Press return key and have the unit capture a signal strength data value instantaneously. Ideally I would like to capture a number of values over a preset time like 100 values in 15 seconds or so. This so I can move the receiver about a room and capture average signal strength. Ideally there should be a timestamp and field to enter information such as: "Building A, Room 201"

Having GPS data field to log as well would be nice for outdoor coverage.

Are there any programs or scripts to do this?

Ideas Thanks

5826. EX2099 Question?

From: rfiemiguy
Topic: 5828 Message: 5828

Hi Can anyone tell me if this software version V.2.1.0.1 (from Files) is fully operational? I have it installed but don't have a radio yet.

If it is an evaluation only, can you advise how long the evaluation period is?

What is involved in registration? How much? Is there an updated version. I sent e-mail to field.pcr1000@... and it bounced.

I would be interested in a sample output file from anyone who has actually used it. the one with the install is blank.

Thanks

Hi Juan Carlos,

I just wanted to say that the PCRAnywhere 2.1.1 seems to work quite well, thank you.

If you are taking input on things that an owner/operator of a publicly available receiver would like to have, I do have a suggestion. The "Management" application would need to include the ability to "see" who is using the radio at any given time and the ability to disconnect them without have to restart the service.

Thank you again for your time and effort to develop and support the software.

5831. Re: [PCR1000] PCR AnyWhere 2.1.1

Yahoo group: PCR1000
Date: 2012-02-22 22:38:20 UTC
From: Serdar ULUKONAKCI
Topic: 5824 Message: 5831

Hi Cliff,
There is an option for log the activity and see who is using the radio.
From technical manual page 22: (
http://files.pcranywhere.com/2.1.1/PCRAnyWhere_2.1.1-TechMan-EN.pdf)
Parameter: LOGLEVEL
Value: Integer: 0 to 2
Example: LOGLEVEL=1
Description: Activates the logging of the clients? activity in a log
file. If active, a daily log file is created in
the directory <PCR AnyWhere root
directory>\webapps\PCR\WEB-INF\logs. The value that is
assigned defines the logging level as
follows: 0=no logs, 1=logs connections and
disconnections only, 2=logs all the
activity. In a heavily used site, the logging level
2 may
result in big log files.

You can add a line like LOGLEVEL=1 to server.conf file.
Regards,

TA3AS

5832. Bonito RadioCom 4.5 Special Edition for PCR1000 narrow FM distorts!

Yahoo group: PCR1000
Date: 2012-02-28 01:21:32 UTC
From: rfiemiguy
Topic: 5832 Message: 5832

Hi; I have Bonito RadioCom 4.5 Special Edition for PCR1000 installed and have for first time used this SW with my PCR1000. When tuning FM narrow channels such as NOAA weather on 162.475 MHz FM mode 15 KHz bandwidth, the signal is very distorted, even if I disconnect the sound-card and use the receivers own or other external speaker. If I select wide FM (WFM) the distortion goes away but the level is very low. It is as if the IF bandwidth is set very narrow and is ignoring the 15 KHz setting. I tried walking the receive frequency above and below the center to determine if the frequency was in error. It is not.

I reinstalled the program and did not change the problem. The ICOM PCR1000 V 2.2 program sounds fine tuning these same narrow band 15 KHz BW frequencies so I know it is not hardware related.

Is there a patch to fix this problem? The only patch on their website pertains to problems starting the program. Creation date for the exe file is: Wednesday, October 16, 2002, 4:55:46 PM

System is WINXP, using serial interface. But USB to Serial converter (TrendNet) has been tried and will be used as well.

Thanks!

5833. Sale/ ICOM PCR1000 with 10.7 MHz IF Output & PalmV

Yahoo group: PCR1000
Date: 2012-02-28 19:48:55 UTC
From: Alexander
Topic: 5833 Message: 5833

Hello Group!

Herewith I offer my ICOM PCR1000 together with a Palm V for sale.

In detail the offer include the following:
- ICOM PCR 1000 with 10.7 MHz output
- AC/DC-Adaptor
- Telescope antenna
- Serial to USB interface
- Palm V with docking station
- Manual (German)
- Software: RadioCOM 5.0 RX with IC SWL Switchbox dongle

The ICOM is in good condition and runs perfectly - I used it primarily as downconverter for my SDR.

I'm looking for 250,- Euros plus shipping.

Potential buyer: Pls send me an email - I can send pictures

Best regards
Alexander

Still looking for information about this SW. Can I contact the developer? The software works after a fashion.

1) I am trying to use with a Trendnet USB to serial dongle that works with other programs but seems balky in the SW finding the comm port reliably.

2) The instructions for using a CSV file don't mention that the program doesn't parse multi channel data properly. Am I missing something?

I can probably get this to work as is, but if there is an update, or registration and key. I would like to know. Am I the only one using this SW?

Help!

Also I note there are about 4 yahoo groups regarding PCR, so if this is not where the "action is" please let me know!

Thanks!

5835. Trendnet (Prolific) USB to Serial Settings

Yahoo group: PCR1000
Date: 2012-02-29 16:58:35 UTC
From: rfiemiguy
Topic: 5835 Message: 5835

I am using a TrendNet USB to serial converter and drivers packaged with it branded "Prolific".

I have some difficulty communicating reliably between the PCR1000 and one of my programs when using it.

I note in settings it shows 9600 bps 8/N/1 and Flow control = none. Do I want this to be forced to 38400 and use hardware flow control?

The Prolific driver may need to be updated.

The start up baud rate for the PCR-1000 is 9600, the software then tells the PCR to switch to 38400...

Some PCR-1000 programs do not play well with USB to Serial converters...

I've never heard of one that has auto-switching capabilities...
To your PC, it's just another RS-232 Port that is controlled by software ;-)

What OS you using?

If Win7, check your power profile settings, and fixt it so that Windows doesn't "manage" (shutdown) the USB subsystem when it thinks the PC is not used (no keyboard or mouse activity.)

The very latest Prolific Win7 drivers appear not to be that stable.

There are some on the Byonics site, dating from 2008 that work well however. http://www.byonics.com/cables/usb.php

If a 64 bit OS, try running the program in a lower compatability mode, but the USB<>Serial drivers must be 64 bit, as they talk dirty direct with the OS itself, regardless of what mode the application works in.

I personally, have not had any issues with my PCR1000 and any USB<>Serial device, Prolific, or FTDI based, Windows 2000, XP, Vista or 7(32) (Once, I got the power management issue out of the way.)

However, the application MUST set the handshake lines High (even if it doesn't do hardware handshake) so that the PCR stays powered up when commanded.

73.

From: rfiemiguy
Topic: 5835 Message: 5842

I am running WinXP on my computers. I have been messing with this on my desktop computer and ultimately it must work on a Toshiba netbook, so I am going to give up on the desktop and see if the netbook (newer hardware) behaves.

This TUS9 is version 1 hardware. I see TrendNet has a V2 and newer drivers. Maybe I will need to get something fresher.

I assume that I need to set hardware flow control on? ICOM PCR1000 V2.2 does not seem to care if it is set on or not, but in reading past posts this seems to matter?

From: acatherder@comcast.net
Topic: 5832 Message: 5843

rfiemiguy, greetings!

I've used the Bonito program and if I am not mistaken, it requires the use of their proprietary dongle. After having issues with the software that was used, I deleted it and have been using the original Icom program as well as testing the program that Jay has put forth.

With all that, I am not familiar with the Trendnet USB to Serial converter, however, some S-USB converters do not play well with XP Pro. Apparently the drivers for the Trendnet are for USB 1.1; if you have a laptop or Desktop that is more up-to-date (i.e. the USB ports are compliant with 2.0) then the drivers from Trendnet may or maynot work. Running in compatability mode in XP might work, however, don't hold your breath.

Now, onto your audio / FM discrimination problem. It's how the Bonito program interfaces with the Icom, and I suspect it's hard coded. (other's here can correct me, I may be wrong..). That's why I got rid of the Bonito program.

BTW, I'm using Win7, 32 bit on a laptop, Gigaworks USB to Serial adapter; (Sold in Radio Shack, $40.00. Pricey I know but, follow the instructions on installation and it works.)
 only issue I had was the Comm port emulation until I selected Comm 5 and no looking back.

Dave

Subject: [PCR1000] Bonito RadioCom 4.5 Special Edition for PCR1000 narrow FM distorts!

Hi; I have Bonito RadioCom 4.5 Special Edition for PCR1000 installed and have for first time used this SW with my PCR1000. When tuning FM narrow channels such as NOAA weather on 162.475 MHz FM mode 15 KHz bandwidth, the signal is very distorted, even if I disconnect the sound-card and use the receivers own or other external speaker. If I select wide FM (WFM) the distortion goes away but the level is very low. It is as if the IF bandwidth is set very narrow and is ignoring the 15 KHz setting. I tried walking the receive frequency above and below the center to determine if the frequency was in error. It is not.

I reinstalled the program and did not change the problem. The ICOM PCR1000 V 2.2 program sounds fine tuning these same narrow band 15 KHz BW frequencies so I know it is not hardware related.

Is there a patch to fix this problem? The only patch on their website pertains to problems starting the program. Creation date for the exe file is: Wednesday, October 16, 2002, 4:55:46 PM

System is WINXP, using serial interface. But USB to Serial converter (TrendNet) has been tried and will be used as well.

Thanks!

I asked about the problem with narrow FM directly from Bonito and am a bit dissapointed in their dismissive contradictory response. The software is pretty cool for HF utility reception. I might consider upgrading to 6.0 but have no assurance about product support. I also noticed it has trouble talking to the radio, even through RS232, gives disturbing eeprom error reports and leaves the radio on even after closing the program. By contrast, the simple Icom V2.2 program behaves just fine.

rfiemiguy:

If you don't need "pretty", look in the PCR1000 files section for a ZIP file named PcrMC98.ZIP. It contains the latest version of the program that I wrote a while ago. It is FREE, so please give it a try. If you like it, keep on using it. If not, nothing spent, nothing lost !! The weakest part is the lack of a HELP file. Instead, I put all of my work into the program itself, and did my best to make it self-explanatory.

There are actually two executables included in this ZIPfile. The first, PcrMC.exe is a DOS text-only version . . . it represents my original program development. Much later in the development cycle, I decided to implement the same capabilities in a DOS 640x480 graphical version as PcrMC-SA.exe. Both of these run very well under multiple versions of Windows (Win95, Win98, WinME, Win2K, WinXP . . . I have not personally tested it in Vista, but it runs great under Windows 7) . . . PcrMC.exe will run either full-screen or in a DOS window . . . PcrMC-SA.exe will only run full-screen (this is a Windows restriction, not a restriction of the program !!).

Either executable can act as a very powerful scanner. In addition, the PcrMC-SA executable performs as a very good spectrum analyzer.

The basic syntax to run the program is as follows:

```
   pcrmc[-sa]  [ -com1 | 2 | 3 | 4 ] [ -fast ] [ -debug ] [ filename ]
```

Note that all command-line options are case-insensitive.

[-com1 | 2 | 3 | 4] : you can specify the COM port on the command-line to override that which is recorded in the PCRMC.INI file.

[-fast] : this will skip the pause on the "HELP" screen as the program is started up.

[-debug] : this will cause a PCRMC.DBG file to be created that will contain time-stamped entries for each command sent to the PCR-1000 and each status returned from the PCR-1000. Note that when the receiver is used as a scanner, this debug file can grow quite large in time !! Be aware of the disk-space requirements by running this for a long time. In your particular case, you can use the info reported in the debug log to correlate your signal strength with your GPS location by matching timestamps.

[filename] : you can specify the "program" file that you'd like PcrMC to initialize with upon startup (it is not necessary to also specify

the file extension as this is assumed to be .PGM). See some of the
included "program" files for examples of how to make use of the
powerful capabilities within the PCR-1000 that Icom's included
Windows program woefully ignores and/or hides from us !!

Good luck & let me know what you like/dislike. It's been quite awhile
since I worked on it, but updates are not necessarily out of the question.
I definitely still use it all of the time. Even though it works especially
well on very old (DOS-only) PCs (since that is what it was originally
developed for), it works equally well under Windows (see above).

A couple of notes that may prove very useful are as follows:
ALT-H shows a help screen (the closest thing there is to a HELP file !!)
ALT-A goes into "automatic" (demo) mode which will let you exercise
          all of the program features even without your PCR-1000 attached
ALT-P starts/stops "program" mode
ALT-S starts/stops "scan" mode
ALT-Q quit without saving configuration
ALT-X exit & save current configuration

Pressing any of the selection keys (for example, O for mode) will cause
that field to blink, indicating the selection that can be controlled using
the up/down and/or left/right arrow keys to change the selection. Press
the ENTER key to complete the selection for that field.

Frequency information can be entered anytime that no other fields are
already active (pressing F first is not absolutely necessary). When
entering frequency information, you can also use the backspace key to
make corrections. As well, you can use the ESCAPE key prior to
hitting the ENTER key in order to discard any frequency changes made
and return to the previous frequency setting.

Some keys take effect immediately (typically those that alternate
between two settings) such as G for AGC on/off, B for NB on/off, etc.
Some keys have multiple functions (but with related control) such as
P for bandscope... pressing P once will let you select the bandscope
speed...pressing P again while the bandscope selection is active will
change the bandscope vertical resolution multiplier.

Feel free to e-mail me if you have any questions, comments, and/or
suggestions for improvements.

Have fun !!

5846. PCR1000 fails to connect PC to radio

Yahoo group: PCR1000
Date: 2012-03-05 19:46:53 UTC
From: Big Red1
Topic: 5846 Message: 5846

I have not used my receiver for a while, when I hooked it back up using a standard rs-232 cable it fails to connect I am using HRD and PCtalk??
Do I need a null cable? or is there some way to reset the receiver.
Any help would be great
73's Terry N4RQ
p/s I am using xp and I know the com port is good??

Hi Terry,

A Null Modem Cable is NOT required for the PC -> PCR connection, you might be thinking of the PCR -> Palm Pilot interface.

Have you double checked your serial cable or tried another?

You can use Hyperterm to test your connection. Set to 9600 baud, 8 data bits and No parity. After you turn your PCR on, you should see H100 repeating. Send H101 to turn on the PCR and if your PCR is working properly, it will turn on...

Jay

5850. Re: PCR1000 fails to connect PC to radio

Yahoo group: PCR1000
Date: 2012-03-07 00:26:28 UTC
From: rfiemiguy
Topic: 5846 Message: 5850

Jay;
I am having a similar problem but with PCR1000 field analyzer program and two different USB-Serial converters.

So far the receiver works reliably with the ICOM V.2.2 program and any type of port (RS232 or USB) and two different USB-Serial cables.

With RS-232 and Hyperterminal, I can indeed see H100 pinging from the receiver but cannot wake up with H101. What is the trick?

Secondly, in trying to troubleshoot Field Analyser (which works fine with RS232) I tried first a Trendnet TU-S9 (hardware version 1) converter cable. This cable failed to communicate with the PCR1000.

Yesterday I bought a pricy $38 cable from Staples. This cable is actually an OEM for Staples by Belkin and has a link, RX and TX light. I bought it because it is locally available and had a lot of positive reviews from a variety of odd applications.

Settings that connect reliably but fail to receive S-meter data reliably are 9600, 8, N, 1 Hardware, TX buffer low (1) to (4) of (16) RX buffer "high" actually mid point (8) of (16).

With the settings in this range, it appears the program properly controls the radio, but fails to reliably decode the S-meter data (which is the point of the software!). If the RX buffer is set to the high range, the S-Meter freezes at a value of -74 dBM, but if set to the low end of the range fails to move off the left peg (no signal).

There is apparently a critical timing parameter inside the program, however the program when used with RS232 works fine on an AMD 2800 desktop processor with Win XP and fine with a tired Compaq 1600S laptop running Win98.

I can however loop back TX and RX pins on the DB9 end of the Staples cable and blast a lot of data through just fine using AccessPort program.

My guess is that the converter cables don't properly emulate RS232, but I can't pin down what else to try.

One thing that puzzles me is that all of these converters require a baud rate setting yet, my understanding is that the PCR1000 negotiates upwards from 9600 to 38400 in operation. The field analyzer program reflects this as its .ini file if edited to 9600 will change to 38400 after a connection is made. Is it possible the 9600 baud setting of the converter cable is thwarting the program from operating at 38400? If so, why does the ICOM V 2.2 program seem to operate fine?

Any thoughts?

5851. Re: [PCR1000] Re: PCR1000 fails to connect PC to radio

Yahoo group: PCR1000
Date: 2012-03-07 02:05:10 UTC
From: Jay
Topic: 5846 Message: 5851

In Hyperterminal, try "No Handshaking"...

Field Analyser may not do well with receiving data from the PCR using a USB to Serial converter. I've seen this same problem on a couple of other 3rd party programs. Those programs expect to see the complete command response in one line of data, but with USB to Serial converters, they send partial data. So when a program expects to see a response like "I120" in one line, the USB to Serial may only send "I1" at one moment and send "20" a moment later. If those 3rd party programs don't assemble the received data correctly, you get junk...

The PCR-1000 does not *auto-switch* from 9600 to 38400. The USB to Serial converters operate just like a regular COM Port where the program has to tell the PCR to Change Baud Rate and then the program tells the COM Port to switch to that same baud rate...

Jay

From: Fred
Topic: 5846 Message: 5852

The S-meter mention reminds me of a less obvious possibility that can be quickly checked.
The PCR1000 can behave oddly (and become warm) if the supply voltage is too high.
Icom twice replaced my "wall warts" for that reason and I now use a stabilised 12V supply.

Fred.

From: Dave
Topic: 5846 Message: 5853

<Snip>
I've seen this same problem on a couple of other 3rd party programs.
Those programs expect to see the complete command response in one line of
data, but with USB to Serial converters, they send partial data. So when
a program expects to see a response like "I120" in one line, the USB to
Serial may only send "I1" at one moment and send "20" a moment later. If
those 3rd party programs don't assemble the received data
correctly, you get junk...
</Snip>

That used to be the case not so long ago with crappy programming
practices that tried to manipulate the USB directly, before the OS's
became aware of it all, and allowed things like virtual COM ports to be
used..

If the application call's the OS's API for Serial ports, in the "normal"
way, specifying a receive terminator byte (LF, CR, or whatever) then you
get the full returned data every time, up to and including the terminator
byte in the COM port buffer you interact with. But yes, USB packetises
stuff, and for some applications (time critical GPS PPS signals for
example) that is not good enough.

I know, I do this for work with all sorts of instrumentation that still
uses RS232 (And RS422/485) and we use both Prolific and FTDI based serial
devices, with Windows (2000 through 7, but all 32 bit) Not only code
I've created, but also NI and Agilent VISA drivers, they all work fine,
no missing data, so long as no cables break or fall out, or batteries
die. We even have RS232<>Fibre Optic serial devices that are parasitic
powered from the USB<>RS232 device. Again, all work well.

Also with Hamlib and Flrig code at home on both Linux and Windows, all
works as expected. Using a mixture of C/C++ and Delphi.

NOTE!!!! However, there were some early Prolific drivers that failed to
clear their RX buffers correctly when instructed to do so by the OS. The
"fix" was to dummy read a pile of junk untill the buffer was empty. But
that was some time ago. There are also a lot of fake Prolific 2303 chip
based devices about. Prolific's latest drivers object to them with an
error. There were some even earlier ones, that didn't implement the
handshake lines correctly (but on the TX side) but I've not come across
any of them (thankfully) for some years now. (Fix by replacement in that
case!)

As to using Hyperterminal. ALWAYS select None for any handshake, if you
are only doing manual typing of commands and mk1 eyeball reception, and
you don't know if it's needed. Then HT will set and fix the RTS and DTR

lines high(+) for the entire session. The PCR should then power up in response to H101(enter) and stay powered.

Look into getting a copy of the old Win3x "Terminal.exe" program (and it's help files.) OK, so you're limited to COM1 to 4, but even though it's a 16 bit app, it still works fine on Windows 7(32 bit.) It's great party piece, is that it has programmable function buttons, and all the settings can be saved and recalled by desktop shortcuts by manipulating the command line parameters. Pitty there isn't anything equal that I've found for later systems that works as well, for free...

If you can see "H100" coming back from the PCR, one entry per line, then the receive side is all working.

If it also works OK with the old ICOM program (that must have been written long before USB came about!) there is nothing wrong with the PC, the USB<>RS232 device, or the PCR. If it doesn't work with some other appliciation software trying to use the exact same hardware, then I leave you to draw your own conclusions.

Build/use a breakout box, to monitor the handshake lines, and see what's happening. Or make your own cable that forces RTS/DTR high for the PCR regardless. 12V via a 470r resistor per pin should do it.

("Propper" RS232 receiver inputs should work with, and withstand up to at least +-24V by the way.)

Regards.

Dave G0WBX.
PC-R1000 owner/user. They work great with HRD!

The meter runs normally as long as an RS232 cable is used. My receiver runs cool and the unterminated wall wart runs at 15.8 VDC which seems OK since the upper tolerance of the receiver spec is +15% above 13.8 VDC.

Topic: 5846 Message: 5855

As I said, the S-meter mention reminded me of a less obvious possibility and problems can even relate to supply voltage variation between standby and normal load.

When I bought my PCR1000 (via Dennis Goodwin of Icom in 1997) it was a "hot product" flying off the shelves and for some reason the PSU provided was an ICOM BC-06-UK measuring 17.5V (21.9V off load). The replacement PSU also gave higher than 16V and the problems repeated (warm casing, lockups on switch-on or after and odd S-meter readings).
The second replacement was an Icom PW00136 universal power supply set to 12V (fine until it failed) and my receiver has worked faultlessly from stabilised 12V supplies.

5857. PCRscope 1.4.1b

Yahoo group: PCR1000
Date: 2012-04-09 11:57:38 UTC
From: Bob
Topic: 5857 Message: 5857

Hi, I'm new to this particular forum, but have been using ICOM receivers for quite awhile.
I'm having trouble installing the PCRScope software, has anyone else had a problem with it?
I'm using Icom software version 2.2.
XP SP3, fairly fast computer (3.06)
I'm just wondering if there is a MS library that has to be installed before this app will work, there arn't any instruction.
The program installs OK, asks for the com port, then asks for the user to stop and restart the PCR, but that's as far as it goes...for me anyway.
Any help would be much appreciated.

Rgds Bob (UK)

5858. PCR seems deaf in certain bands

Yahoo group: PCR1000
Date: 2012-04-09 16:31:23 UTC
From: Stuart
Topic: 5858 Message: 5858

Hi All

Just dug out my old PCR-1000 which hasnt been used for a year or more.

Installed TalkPCR and connected the PCR to my half size G5RV antenna that I use with my Yaesu FT-102 Transceiver.

With the FT-102 the 20M and 40M bands were very lively and I could hear a number of hams at S9+

When I tried to hear them on the PCR I could barely hear anything.
Managed to hear 1 or 2 hams but signal was very low and no deflection on S meter.

Also I couldn't pick up any MW/LW stations and i'm sure it did previously with just a bit of wire as an antenna.
Did notice when tuning from high to low through 1.8mhz there is a big drop in background noise.
I know this is a band switching point so does this indicate a problem or is it normal?

VHF FM broadcast bands seemed ok or at least I was able to tune quite a few

Any suggestions?

Cheers

Stu

Quick update

MW/LW are completely deaf with the ATT switch out ie no attenuation

But when I press the ATT switch I can hear stations again.

Its like its working the wrong way around or more accurately I cant hear anything with ATT out

The ATT switch seems to work as expected on VHF broadcast bands

ie I get an Smeter drop of a couple of db when i press in ATT

If you have the original Icom software, try that initially.

Check adaptor / patch lead G5 coax to BNC, could be a short, test with DVM for continuity / short.

If you push the end of long a wire into the centre pin socket of the BNC connector on back of PCR what do you hear? Check for squelch level, correct filter width and that attenuation is off.

Doug

5861. Re: PCR seems deaf in certain bands

Yahoo group: PCR1000
Date: 2012-04-09 20:20:58 UTC
From: Stuart
Topic: 5858 Message: 5861

Ok thanks but checked all that
See my 2nd post regarding attenuation switch

Does the same with Icom s/w and talkpcr

I've tested again and with attenuater sw in ie attenuated I can hear most stations from 1.8mhz down to 200khz
With the attenuater sw out ie not attenuated all these stations are gone and i just get static

1.8mhz and above the atten sw seems to work as normal ie when it is activated there is a drop in signal strength on strong tuned stations

HF ham bands still seem very low
I can hear some hams but signal strength is very low and voices are barely audible

Same bands on my FT-102 with same antenna I hear 10 times more hams and signal strengths are S9 +

Stu

Stuart

I don't mean to question you on the obvious, but you do know that band conditions have been unbelievably bad lately don't you? I've just dialed through all HF bands with four receivers (PCR-1ooo, SX-122, R75, G3), and three antennas and heard exactly nothing at my location(N Ca). Even WWV is barely readable. Night-time has been a little better, but way off from "normal".

Yes I know conditions are not ideal but compared the PCR-1000 to the FT-102 within minutes of each other.

Also cannot understand the strange behaviour of the atten switch below 1.8mhz

Cheers

Stu

From: Joe Leikhim
Topic: 5858 Message: 5864

Maybe the PCR1000 is overloaded with the G5RV? Try finding the strongest HF signal you can, use a short wire antenna to receive, then see if the attenuator behaves. My ges is the PCR1000 does not have the front end selectivity of your other receiver.

Yahoo group: PCR1000
Date: 2012-04-11 21:36:11 UTC
From: Stuart
Topic: 5858 Message: 5865

Ok confirmed something was definately wrong as my VX7-r handheld was picking signals up 8db higher across the board with only a rubber duck antenna.

Got stuck into it and found D1 and R1 had toasted and were open circuit effectively disconnecting the antenna.

I think R1 is 390ohm but the schematic is hard to read.
Nearest I had was 470ohm and I had a glass signal diode from a scrap board. Neither were surface mount

Soldered both in as best I could as there isnt a lot of room and tucked them out the way and insulated with tape.

Turned on and all fixed
Booming signals across the board even below 1.8mhz

Attenuator works perfectly but is applying more attenuation than before but suspect this is the higher value of resistor I used

Anyway i'm happy

Cheers

Stu

From: bluegoose_46
Topic: 5868 Message: 5868

Hi,
I fired up my 1k today for the first time in many months, and found on all bands I have no audio. It's almost like the antenna is disconnected.

I tried a rubber duck, and the roof mount but got nothing.

Anyone have any idea on what may be the issue?

Did you check all modes? I have found with the Icom control SW, if running the spectrum scope in some modes there will be no audio. Confused me a bit.

Also, the "speaker jack" is attenuated by a switch inside if you intend
to use a Sound card.

Hi,
I've been poking about and it seems that the antenna is not connected to the front end. I get the same condition across all bands. I can only assume that having had it connected to the external antenna but not powered or grounded, I've managed to fry the front end.

The question is is it worth repairing? If so where would it be best to send it. I don't have any test equipment apart from a Fluke meter

Topic: 5868 Message: 5873

Is it totally deaf on all the bands?
Ie is there any difference between 1.7999 and 1.8mhz etc

Try it with the ATT switch ON, yes ON, any difference?

Connect some sort of probe wire to your antenna and connect it to the junction of c2 and r8 for example and see if you here stations
This point bypasses the ATT circuit and the first handful of front end components

Check R8 for open or short and check the 2 diodes that connect to it (sorry cant remember there numbers off hand) for open or short.
Also check they are forward biased when turned on ie 3.6v on the cathodes.

Let me know

When I blew the front end (static discharge) of my PCR1000, I elected to
send it back to ICOM for out of warranty repairs.

They repaired it and I have been happy with it since.

I'm sorry, but I do not remember what they charged me for the repair.
But I do remember emailing them for a quote first.

TrunkPCR version 0.90.283 Now Available for Downloading from the NEW Homepage:
"http://www.fiftyonefiftysystems.com/TrunkPcr/TrunkPcrDwnld.html"

NOTE: Moto Type-I Support *should* be finished in the next major update.

This update has Four Fixes, Seven Additions and One Change...

Mar 15,2012 - Fixed: OverFlow Error in COM Routines.
Mar 25,2012 - Fixed: Controlling a PCR-100, PCR-1000 & PCR-1500 in Dual Receiver.
Mar 26,2012 - Added: Monitor CTS in Main COM Port Selector.
Mar 26,2012 - Added: Ignore CTS/Monitor CTS in Dual COM Port Selector.
Apr 25,2012 - Added: 26 More Trunk Banks [a] to [z] to help organize your Trunk Groups.
Apr 25,2012 - -----: Main GUI and BandScope Height Increased.
Apr 26,2012 - Added: Hold Active Group Button in CCA's Control Tab.
Apr 27,2012 - Added: Block Digital Calls for EDACS in Trunk Settings.
Apr 27,2012 - Fixed: Squelch Indicator Works Propperly Now in Trunking.
Apr 28,2012 - Added: Temporary LockOut of Groups. When You Click the L/Out Button,
You can Press these Keys in Combination for a Different Period.
(SHIFT) 1 Minute.
(CTRL) 2 Minutes
(ALT) 5 Minutes
Apr 28,2012 - Added: Text Color of the TrunkBank (TB) Column in CCA's Control Tab Now indicates
if a Group is Locked Out.
Apr 29,2012 - Fixed: Glitch when Squelch Opens, but Doesn't Resume Trunking.
Version 0.90.283 Released 04/29/2012

Regards,
Jay

5877. PCR 1000 FOR SALE

Yahoo group: PCR1000

Search Google...

You'll need CTS, RTS & DTR too. Might as well save yourself some time and make a cable with ALL 9 Pins ;-)

If you don't use CTS your PCR-1000 will turn off...

5888. flrig now supports PCR-1000

Yahoo group: PCR1000
Date: 2012-06-04 20:40:55 UTC
From: bski
Topic: 5888 Message: 5888

The new version of flrig, version 1.3.03, now supports computer control of the PCR-1000. Its a pretty basic interface, no scanning or bandscope functionality, however flrig interfaces to fldigi which will lets you decode most digital modes and related modes like RTTY and CW easily. Both flrig and fldigi run on Windows, Linux, and Mac OS X. More information on downloads are at http://www.w1hkj.com/. Support for these programs can be found on the linuxham yahoo group.

Cheers,
Brian

5889. PCR-1000 Dead?

Yahoo group: PCR1000
Date: 2012-06-09 18:42:16 UTC
From: GMR
Topic: 5889 Message: 5889

Help? I have not used PCR-1000 for a few months and today I fired it up using ham radio deluxe version 5.0 on a computer running windows XP service pack 3. I have my scanner antenna plugged into the 1000 and have the radio tuned to 162.55 my local noaa frequency and I am picking up nothing. I hear static, mode is AM, I tried all filter settings, the gain is set at 100 and the squelch is at 0. I am concerned that the radio has died. I am very inexperienced with this radio but thought I should at least be able to tune in something simple. There is no difference in the static with my antenna plugged or unplugged. The scanner antenna works fine because I use it with my scanners. I also tried in running talk PCR, but got the same results. The last time I tried the radio I was able to receive some stations. If anyone can help me troubleshoot this radio I would really appreciate it.--Gary

Gary,

If you tune the box to a commercial VHF FM broadcast frequency 100 - 104MHz
or so (your local FM radio station) do you hear anything other than noise?
Do you have any transmitters, CB or PMR, which you could use to generate a
test signal?

Doug

Try 6k wide FM.

Also locate a frequency on your scanner, and then dial in that frequency
on your PCR-1000.

As a side note, most frequencies you would want to listen to that are
above 130MHz are probably FM.

You could also try dialing in a broadcast Fm station, just set the
filter to WFM (230k wide). and select a frequency between 88MHz and 108MHz.

Bill,
I tried you suggestions (and the ones made by others) and all I get is white noise, no hint of a signal at all. I have it set on the FM band, filter is 230 and mode is WFT. The radio is warm so I know it is getting power. I keep thinking I must be doing something wrong since I am inexperienced with this radio, but it was working a few months ago. Is there somewhere I could send it to have it repaired or have it checked out.?

I hate to say thiis however if you cannot get any signals on any band maybe the front end has been blown there are some diodes in the front end that blow out some times.
I have repaired mine a few times for this issue.

The first step is to go to the Icom website and download teh PCR-1000 software and start from scratch. If it doesn't work with the original software, it is brain dead. I have one that went belly up like that for no reason.

Topic: 5889 Message: 5896

On 06/09/2012 07:57 PM, Gary Moyer wrote:

Gary, What software are you using to control the PCR-1000?

I am currently using the original software distributed by ICOM...
which works under Windows, and if you use "wine" can be run under Linux
as well. (My PCR is attached to my Linux system)

As K5TED said, download the software from the ICOM site...
and just like Matt said, you might have "blown" the front end (static
discharge, etc.)

I have Lightning Surge Protector on my outside antenna, something I did
after having ICOM repair my PCR-1000 for me a few years back.

I located their address and an email contact from their website, and
asked for a price quote. The price I was quoted seemed reasonable, so I
sent it to them for repair --- and I have had no regrets in doing so.

It has been working quite well for me, ever since - they had to replace
the front end diodes, an FET, and another IC.

I'm thinking that a "near by" (1/2 mile away) Lightning bolt strike
caused the problem - so I purchased a MFJ-270MF protector from MFJ
Enterprises
(http: www.mfjenterprises.com) to assist in preventing similar
problems in the future. (I was already using powerline protectors...)

Another "minor" benefit of sending it to ICOM, is if there is something
wrong with the ROM, they will replace and/or reload it, and re-align the
receiver for you! From your description, It sounds like the front-end
has been "damaged" but the receiver will also stop working if the
information
in the ROM has been corrupted.

You say the radio is warm - it should not be.
The radio can behave oddly if your supply is much above 14 Volts.
(Mine runs constantly cool and reliable from a 12V stabilised supply)

Double check your RS232 cable and port settings too.

With all fault finding the first check is that supplies and connections are correct - and that nothing has changed!

:-)

Fred.

You might want to check that the communication over the serial port is working:
1. Start a terminal emulation program, Hyperterminal for example.
2. Set the settings to 9600 baud, 8 bits and no parity.
3. Connect to the serial port that your receiver is physically connected to.
4. After connecting power to the receiver you should see a repeating
string of "H100".
5. If this is the case send the string "H101" to the receiver. My
receiver responds with the string "G00".
Info about the PCR1000 Command List can be found here:
http://www.gm4jjj.co.uk/PCR1000.html

....and will happily run on 13.8v and car supply which varies quite a bit 14v or more, the unit has a regulator. Do you have anyone near who has one and perhaps test that way? The 232 connection is an angle but when you change mode does the white noise change in any way, can you 'squelch out' the noise and does the volume level change on moving the slider?

Regards,
Doug

You say the radio is warm - it should not be.
The radio can behave oddly if your supply is much above 14 Volts.
(Mine runs constantly cool and reliable from a 12V stabilised supply)

Double check your RS232 cable and port settings too.

With all fault finding the first check is that supplies and connections are correct - and that nothing has changed!

:-)

Fred.

Bill,
I tried you suggestions (and the ones made by others) and all I get is white noise, no hint of a signal at all. I have it set on the FM band, filter is 230 and mode is WFT. The radio is warm so I know it is getting power. I keep thinking I must be doing something wrong since I am inexperienced with this radio, but it was working a few months ago. Is there somewhere I could send it to have it repaired or have it checked out.?

Try 6k wide FM.

Also locate a frequency on your scanner, and then dial in that frequency on your PCR-1000.

As a side note, most frequencies you would want to listen to that are above 130MHz are probably FM.

You could also try dialing in a broadcast Fm station, just set the filter to WFM (230k wide). and select a frequency between 88MHz and 108MHz.

I tried the original Icom software and still nothing. I just sent an email to Icom asking them to quote me a cost for repairing it. I hope it is not too much because funds are very tight. I lost my job 3 years ago and have retired early than planned. I would hate to get rid of it since it is a radio I always wanted and was only beginning to learn how to operate it. Thanks everyone for all the help.--Gary

I have the same issue with my PCR-1000 and I keep finding the same info when I search indicating that "some diodes in the front end blew and can be replaced" but no further detail. I've asked for more info in this group to no avail.

Would you be kind enough to share with the group...

Which diodes are these specifically on the schematic?
Where are they physically?
Where exactly can you get these diodes?
How many of them are there and based on your experience do you replace all or some of them and whats the reasoning?

Thanks

Sam

Sam
I will have to try and find the schematic and take a look and give you the right diodes to take a look at and test.
Or you could send it to me and I can take a look at it and hopefully nothing else has been blown.
I am thinking it would be faster if I could find the schematic on line my shack is a real mess right now I have changed things around and moving all kinds of radio and transmitters to make a better working shack.
Let me what I can do.

Sam take a look at the SCHematic start with D1 2 6 7
I believe I had a defective D2 just cannot remember at the moment.
This is the area you need to look for open or shorted diodes

I think R 5 was open also this where you need to start.
Your dealing with very small components becare not to burn or mess up the board when taking these parts out.
Let me know what you find.

Before you go to trouble opening it up and replacing diodes, I would highly recommend installing the ICOM OEM software and trying to operate it with a serial interface using a computer of WINXP or prior operating system. This being said, I had troubles initially with mine because I had the spectrum display turned on and the receiver demod would not work with the spectrum display on simultaneously (per design).

Also, I tried using the RadioCom 4.5 software and found that the FM demod does not work at all due to a problem with the software, the audio is weak and garbled. And support is nonexistant.

In short, I am suggesting that HRD may be buggy, or your computer interface could be buggy. Get back to the basics and install the Icom OEM software, try another computer, use an RS232 not USB interface!

I got the hourly rate back from Icom. They charge $84 an hour. I really can't spend that kind of money right now. They said if I called they could give me an actual quote which would cost $42 but it would be waived if I went ahead and did the repairs. I guess I will have to try to save the money up and have it repaired later. Thanks everyone for your suggestion. If I knew someone here in Jacksonville, FL I would ask if they would check it out for me, but I don't know if anyone here is familiar with this radio. I have tried all of the software I have, even on an old windows 98 laptop and I can't get it to work. I keep hoping it is just some stupid I am missing.--Gary

Gary:

I'll admit that I'm joining this conversation late & I may have missed earlier comments/discussions that may have already covered some of this . . .

Just to make sure that your cable is not the problem, have you tried a known-good straight-through serial cable ?? Are you using the cable that originally came with your unit or something else ??

For another simple (but powerful) program to try, I would suggest that you look in the PCR1000 files section for a ZIP file named PcrMC98.ZIP. It contains the latest version of the program that I wrote a while ago. It is FREE, so please give it a try. If you like it, keep on using it. If not, nothing spent, nothing lost !! The weakest part is the lack of a HELP file. Instead, I put all of my work into the program itself, and did my best to make it self-explanatory.

There are actually two executables included in this ZIPfile. The first, PcrMC.exe is a DOS text-only version . . . it represents my original program development. Much later in the development cycle, I decided to implement the same capabilities in a DOS 640x480 graphical version as PcrMC-SA.exe. Both of these run very well under multiple versions of Windows (Win95, Win98, WinME, Win2K, WinXP . . . I have not personally tested it in Vista, but it runs great under Windows 7) . . . PcrMC.exe will run either full-screen or in a DOS window . . . PcrMC-SA.exe will only run full-screen (this is a Windows restriction, not a restriction of the program !!).

Either executable can act as a very powerful scanner. In addition, the PcrMC-SA executable performs as a very good spectrum analyzer.

The basic syntax to run the program is as follows:

```
   pcrmc[-sa]  [ -com1 | 2 | 3 | 4 ] [ -fast ] [ -debug ] [ filename ]
```

Note that all command-line options are case-insensitive.

[-com1 | 2 | 3 | 4] : you can specify the COM port on the command-line to override that which is recorded in the PCRMC.INI file.

[-fast] : this will skip the pause on the "HELP" screen as the program is started up.

[-debug] : this will cause a PCRMC.DBG file to be created that will contain time-stamped entries for each command sent to the PCR-1000 and each status returned from the PCR-1000. Note that when the

receiver is used as a scanner, this debug file can grow quite large in time !! Be aware of the disk-space requirements by running this for a long time.

[filename] : you can specify the "program" file that you'd like PcrMC to initialize with upon startup (it is not necessary to also specify the file extension as this is assumed to be .PGM). See some of the included "program" files for examples of how to make use of the powerful capabilities within the PCR-1000 that Icom's included Windows program woefully ignores and/or hides from us !!

Good luck & let me know what you like/dislike. It's been quite awhile since I worked on it, but updates are not necessarily out of the question. I definitely still use it all of the time. Even though it works especially well on very old (DOS-only) PCs (since that is what it was originally developed for), it works equally well under Windows (see above).

A couple of notes that may prove very useful are as follows:
ALT-H shows a help screen (the closest thing there is to a HELP file !!)
ALT-A goes into "automatic" (demo) mode which will let you exercise
          all of the program features even without your PCR-1000 attached
ALT-P starts/stops "program" mode
ALT-S starts/stops "scan" mode
ALT-Q quit without saving configuration
ALT-X exit & save current configuration

Pressing any of the selection keys (for example, O for mode) will cause that field to blink, indicating the selection that can be controlled using the up/down and/or left/right arrow keys to change the selection. Press the ENTER key to complete the selection for that field.

Frequency information can be entered anytime that no other fields are already active (pressing F first is not absolutely necessary). When entering frequency information, you can also use the backspace key to make corrections. As well, you can use the ESCAPE key prior to hitting the ENTER key in order to discard any frequency changes made and return to the previous frequency setting.

Some keys take effect immediately (typically those that alternate between two settings) such as G for AGC on/off, B for NB on/off, etc. Some keys have multiple functions (but with related control) such as P for bandscope...pressing P once will let you select the bandscope speed...pressing P again while the bandscope selection is active will change the bandscope vertical resolution multiplier.

Feel free to e-mail me if you have any questions, comments, and/or suggestions for improvements.

Have fun !!

Things to look at. Start from PC and work your way to radio.

PC Serial Port
What is serial port COM Port? COM 1-4?
COM 1 & 3 can't co-exist.
COM 2 & 4 can't co-exist.
COM 1&2, 1&4, or 2&3 is ok.
Internal Modem?
They tend to default to COM 1 or 2, depending if internal serial port exists.
Disable it.
Serial Cable
Did serial cable come w/PCR1000 or did you acquire it later?
Not all 9 pin M-F Serial cables are straight-thru.
Is it good cable?

PCR1000 Data port
Use original ICOM Control Software from their website or from PCR1000 CD.
If you need to download software, see links below.

Do you have another communications device (scanner, ham radio, etc) that has a 9 pin female connector that you can test your PC COM Port/Serial Cable setup with to either rule out or rule in the PCR1000?

ICOM PCR1000 Control Software v2.2
http://www.icom.co.jp/world/support/download/firm/IC-PCR1000/2_2/index.html

ICOM PCR1000 Manual

5909. PCR1000 - listening but not talking (rs232)

Yahoo group: PCR1000
Date: 2012-06-15 08:47:44 UTC
From: nick_norman2002
Topic: 5909 Message: 5909

Hi,

Just got this radio (ebay - not giving feedback yet!) The radio works OK-ish under both Linux & Windows, but no band scope, no S-meter & the Icom software complains about communication problems ... in a terminal programme there are no H100 nor any other response to commands like I would expect.

I can turn the radio on, tune it etc, via rs232, but get no reply to any/all requests.

So is the ROM scrambled? The PCR1000BUR says - no radio - I presume because it can't see any reply from it, so can't back-up or restore a ROM image.

Ideas?

Gary;
What are you using for a speaker? Mine I have connected to a sound card because there is an internal switch which attenuates the audio to use the line in of the sound card. If you have a 4 or 8 ohm speaker plugged into that jack you may not hear much if anything.

Perhaps a silly question, but have you checked the serial cable to confirm
the RX and TX lines are both properly connected?
If so another possibility is a faulty RS232 interface IC, and yet another
is that the problem might be at the PC end.
And if you're using an RS232 to USB converter rather than a direct serial
connection that's also a possible culprit.

because it can't see any reply from it, so can't back-up or restore a ROM image.

Ideas?

Nigel,

The serial _should_ be 100% I've used it for other purposes and all 100%
(it is usb-rs232 but it does have the hand shake lines as well - I
always check)

Have tried several usb-rs232 adapters but all with the same result, I am
just installing Win XP (spit) on a redundant machine that has a _real_
rs232 port as a final check.

Thanks

Regards

Nick

Have you checked your power supply voltage is not too high?
I had freezing S-meter, comms and other problems with original and replacement Icom wall warts giving above 16V on load and the receiver / regulators ran hot.

It now always runs cool and stable at 12V.

Fred.

HI,

a little over 12V as advertised by the psu!

However a bit of further testing reveals that on an old PC with a _real_ COM1 all works as intended but not via a USB-RS232 even though they work in all other applications to send & receive data - very odd, very odd indeed.

So what is it about the use the PCR1000 put the rs232 port to that fails with USB->RS232 but all other tasks I use them for they are OK?

OK further work is needed to define the problem - can you 'T' com ports?

Thanks all

Nick

Glad to hear the radio is working ok after all.

I'm not sure it's really a fault of the PCR1000, they're known to work with the right USB to serial interface but such interfaces have always had a reputation for being a bit hit and miss, often depending on which chip set has been used.

If by "T"ing COM ports you mean connecting more than one device to the same port, it can be done but only if one device is purely attached for monitoring purposes only. Having two devices attached that are both trying to control the port is a recipe for disaster.

Hi Nick,

Some USB / serial adapters work some don't. Maybe someone on this list has had success and can tell you what does the job - in my case a Prolific device does work but others say not. Good you found the problem.

Best regards,
Doug - Glasgow

Some programs for the PCR-1000 were not written when USB to Serial adapters were around. They are expecting a complete response when a command is sent to the PCR, so if a Program queries the power status by sending "H1?" and expecting a "H100" or "H101" response, the USB-To-Serial may only send "H1" at one moment and "00" or "01" right afterwards...
These older programs do not combine the incomplete peices and may just ignore them.

My Programs: TrunkPCR, PCR Pro and PCR Remote communicate properly with the USB-To-Serial adapters. If you haven't tried them out yet, you should :-)

Jay

Nick (& anyone else looking for a USB-to-serial adapter that works !!):

Here's a repost of a message (with links updated to be current) that I have sent out in the past to several different Yahoo groups regarding a highly recommended (from my personal experience) USB-to-serial adapter:

Here's a product that I personally own & highly recommend for anyone that does not have a native serial port: Parallax (a well-known hobby company supporting all kinds of uP development support products & peripherals) offers a USB-to-serial adapter that works fabulously (I use it specifically under Win7, WinXP, Win2K, WinME, & RedHat linux). It also has the unique feature that it supports handshake signals (DTR for sure), as well as being USB 2.0 compatible. It is available in two flavors:

1) adapter only (no cable) for $14.99, stock #28030
    at
<http://www.parallax.com/Store/Accessories/CablesConverters/tabid/166/CategoryID/40/List/0/SortField/0/catpageindex/2/Level/a/ProductID/378/Default.aspx>

2) adapter plus 6 foot type A-to-mini B cable for $17.99, stock #28031
    at
<http://www.parallax.com/Store/Accessories/CablesConverters/tabid/166/CategoryID/40/List/0/SortField/0/catpageindex/2/Level/a/ProductID/379/Default.aspx>

The drivers for these adapters are available for download from the Parallax website at
    <http://www.parallax.com/tabid/530/Default.aspx>

I use it for all kinds of things on both my desktop & my laptops (HP, Gateway, Compaq, & Dell) & have NEVER had any trouble with it in any way. It might appear more expensive than your average USB-to-serial adapter, but when you consider the number of messages on the Yahoo Groups regarding "I just bought the XXXX USB-to-serial adapter & I can't get it to work . . . HELP . . . ", this is a product that is well worth the price in quality & reliability !!

Disclaimer: I have no connection to Parallax, other than the fact that I have bought MANY of their products (read that as having sent LOTS of well spent $$$ to them !!), & have integrated many of the items that they sell (both uP's & peripherals) in a large number of my hobby projects, and that I am a happy & continuing customer of theirs.

To keep this on-topic, I have personally used this USB-to-serial adapter extensively for programming my PocketTracker, my TT3s, & both of my TT4 beta units. As another example, I have also used it in combination with my simple CI-V cable to control my IC-756PRO, IC-7000, IC-706MKIIG, IC-R10, IC-W32A, & IC-T81, each using HRD, and I regularly use it to control my two PCR-1000 receivers.

OK - that's encouraging, Nick.
Looks like you have the dreaded USB-Serial adapter don't work problem.
Prior posts are worth reading as it's probably the most discussed topic on this forum.

(I've had success with a Profilic chipset one from Maplins for years).

Fred.

P.S. Did you know that an old Palm Pilot PDA with serial port can control a PCR1000 too?
(There's info and progs in the files section).

All,

Thanks a lot.

The mystery deepens ...

In an attempt to solve the problem of moving com ports (I'm on Linux so
/dev/ttyUSB? to be accurate) I put in a 'new' usb hub and wrote a few
rules - that worked sort of - but the radio sprang to life. Not changed
back but it seems not the usb-serial problem (I choose mine carefully as
I often need the handshake lines etc. that many don't provide) but the hub.

Well go figure as they say!

So all sorted but I'd still like to know _why_!

Decoding rtty via fldigi as I type.

Many thanks & best regards again to all,

Nick

Whoops, hadn't even considered you might be running via a hub, they're even less predictable than the USB to serial adapters themselves.

It does get more difficult to manage without them, especially with laptops and limited USB ports, but even with equipment already fitted with USB ports it's quite common to see the instructions advising that only a native USB port should be used and that hubs should be avoided.

regards

Nigel

Hi Nick,
You can try PCRAnyWhere remote or local controlling and listening your receiver. (www.pcranywhere.com) PcrAnyWhere has win, Linux and Mac versions. Linux and Mac versions are beta now. You can download and try with your USB to RS232 converter.

Hi all I have just bort an Alinco DJ480 and have tried to do the expanded tx and rx mod by holding the lamp key and turning the radio on. It has no efect at all. I have also tried holding the F key and the lamp key and turning the radio on but still no luck. Does any one have any idea why its not working? I seem to remember that there might be an internal mod to do before the keypad mod will work but its so long ago I cant remember.
Any help at all would be great.
I am also looking for a ctcss unit for one of these if any one has one for sale.
Thanx

It could be a cable problem. It's been a while since I've played with that program. I have used a USB device. Try a full 9 pin if you are not already.

Hi Bob,
I assume you are using a system that does not allow you to install a Com port board, and that you are using a DB9 to USB cable. Some things also depend on your operating system but these general thoughts apply to most situations.
Firstly, if you go into device manager and double click on the USB port you are using, does the properties menu allow you to change the port from 3 to 1? If not then,
Secondly, did the DB9 cable supplier provide any drivers on a disc? If they did then look for a driver related to your OS and install it. This may give you the ability to assign the right COM address (COM1 is 3F8 with IRQ4). If you don't have a disc then,
Thirdly, go online and look for USB to Serial drivers -- there are many generic ones out there, or you may find one on your cable manufacturers site. Look for one which suits your OS and maybe even mentions your type of cable and/or chipset.
NOW IMPORTANT, before you make any changes with these drivers create a restore point on your system so that if all goes wrong you can return to square one.
Finally, if this is successful at all then you must always use the same USB port for your device, it's the only one which will be recognized as COM1. Any others will still be assigned by the OS.
I hope this helps and please let us know how you get on,
BG

Hi BG, thanks for your detailed advice, I completely agree with the procedure you suggested.
Here goes.
I have the PCR running perfectly in all aspects on Com 3 via a USB to serial lead, with the proper USB to serial driver installed.
Fastish PC (3.06mHz duel core) running XP SP3.
I have a weather system running on the genuine RS232 COM1, I havent tried swapping the weather system for the PCR, but if I did, I suspect it may or may not work.
My thinking on this: The software was written some time ago and may not be compatible with the XP OS and also may not work via a USB/serial device on any OS.
One answer I received stated that although they were using a genuine RS232 port, the software still doesn't work, and was also looking for an answer.
Is the author still around I wonder?
I would like to know from anyone that has managed to get PCRScope working on any Windows platform, and if so, what configuration/procedures were used?

Thanks to all that contributed.
Rgds Bob(UK)

Hi Bob,
I assume you are using a system that does not allow you to install a Com port board, and that you are using a DB9 to USB cable. Some things also depend on your operating system but these general thoughts apply to most situations.
Firstly, if you go into device manager and double click on the USB port you are using, does the properties menu allow you to change the port from 3 to 1? If not then,
Secondly, did the DB9 cable supplier provide any drivers on a disc? If they did then look for a driver related to your OS and install it. This may give you the ability to assign the right COM address (COM1 is 3F8 with IRQ4). If you don't have a disc then,
Thirdly, go online and look for USB to Serial drivers -- there are many generic ones out there, or you may find one on your cable manufacturers site. Look for one which suits your OS and maybe even mentions your type of cable and/or chipset.
NOW IMPORTANT, before you make any changes with these drivers create a restore point on your system so that if all goes wrong you can return to square one.
Finally, if this is successful at all then you must always use the same USB port for your device, it's the only one which will be recognized as COM1. Any others will still be assigned by the OS.
I hope this helps and please let us know how you get on,
BG

OK Bob, now I see what you are trying to do. I confess I thought your problem was more with the COM port assignment.
The only other suggestion I have right now is to remove the program, if it is already installed, and then install again but this time choose compatibility mode. This makes XP act as though it is an earlier version of Windows, and may allow the program to run properly. The only snag I see is that I think in XP the choice only goes back to WIN98, and PCRScope may be expecting 95. Still it may be worth a try if you haven't done this already.

I've used PCR Scope on WIndows and Windows 98 with a real RS-232 COM Port...

This program may not work well with RS-232 to USB adapters if the Comm Routines do not assemble the received data properly...

PCR Pro has the same Spectrum Sweep display that PCR Scope has and works on Win95 to Win7 too, even with USB adapters :-)

I installed PCRScope to Com4 (Profilic USB to RS232 adapter) and it returned "Not G410" and "Squelch error".
Uninstalled it with Revo Uninstaller (which also cleared 25 Registry entries).
The operating system is Windows XP SP3 on my Dell Inspiron Portable.

Installed again to COM1 (DB9 serial cable to RS232 port) and PCRScope worked fully.
There was no need for compatibility mode. The file version is 1.4.01 but comes up as 1.4.1 b Windows 95 on the opening screen.

I then uninstalled again as I use COM1 & 3 for other applications and vastly prefer "Spectrum Analyser GM" by MM5AGM.

I looked for where you might find Spectrum Analyser GM but as links (e.g. from http://norqvist.name/links_radio.php) appear to be broken, try....
web.archive.org/web/20080327192812/http://www.mm5agm.pwp.blueyonder.co.uk/SpectrumGM.zip

Topic: 5889 Message: 5938

I finally gave up on messing with the PCR-1000 and sent it to Icom for an estimate. Below is the estimate I received. I just thought some of you might like to see the cost to have it repaired. It was more expensive than I was hoping for. Any ideas as to what might have caused these parts to quit working? I had some lightening close by and I may have had a wire attach to the aluminum around the eaves of my home as an antenna. I also sent them the power supply to check out since I was told that the radio should not be hot while operating.--Gary

Description of repairs required

Replace damaged band switching diodes.

Replace bad 1st mixer IC.

(6) REPAIR LABOR RECEIVERS $ 21.00 $ 126.00

(4) 1750000620 $ 1.64 $ 6.56
(1) 1790000450 $ 1.07 $ 1.07
(1) 1110004470 $ 15.15 $ 15.15
Total $148.78

This is typical of front end damage from some sort of input overload so a nearby lightning strike would seem to be quite a likely suspect. Having the receiver antenna too close to a transmitting antenna might be another option.

I'm surprised it took out the first mixer without also damaging Q12, the RF amp directly in front of it, but these things happen, and as always it's the labour charge that's the killer when it comes to repair.

Six hours sounds a bit excessive to me, given that they're probably already familiar with the board layout, but I suppose that would also depend on how thoroughly they check it over after repair.
Certainly for that price I'd attempt it myself, on the basis of not having too much to lose.

I have a Pcr1000 and I just use the wall wart that came with it. I believe it is just a 12 vdc supply as when I was using it in the vehicle I just used 12 volts off the vehicle. They do run warm especially if the room is 70 degrees or warmer. Mine has been running constantly for about 3 years now , its providing ATCS monitor to the web and is never off. The only time mine runs just warm instead of really warm is in the winter when its about 60 degrees in that corner of the house, so I would not worry about the heat it gives off.

When you say wallwart, I wonder what you mean. The early 1000 came with a big chunk of a wall wart that weighed about two pounds and ran pretty cool. It was replaced later with a smaller one.

Subject: Re: [PCR1000] Power Supply Source Wanted

I have a Pcr1000 and I just use the wall wart that came with it. I believe it is just a 12 vdc supply as when I was using it in the vehicle I just used 12 volts off the vehicle.
They do run warm especially if the room is 70 degrees or warmer. Mine has been running constantly for about 3 years now , its providing ATCS monitor to the web and is never off.
The only time mine runs just warm instead of really warm is in the winter when its about 60 degrees in that corner of the house, so I would not worry about the heat it gives off.

I received my 1000 back from Icom and it now works great. I am still concerned about my power supply (walwart) and the fact that the 1000 is still running very warm. Does anyone know of a source for a power supply that will work with the 1000? Thanks--Gary

A warm PCR1000 casing means the regulators are having to work hard. Check your wall-wart voltage with the receiver off and on. Simple unregulated "12 Volt" wall-warts can provide such excessive voltage on-load that the receiver runs warm and may even suffer intermittent problems and lock-ups.

Use any nice quiet (non-switch mode) regulated 12 Volt supply and your receiver should run notably cool and reliable for as many years as mine.

Fred.

From: phil_w2lie
Topic: 5951 Message: 5951

I'm looking to buy another PCR model to replace my non-functioning PCR-1000. Seeing how much Icom charges per hour, I'm figuring I might as well look to replace the damaged unit and think about a repair later.. For those interested, I lost the receive on all modes and all bands. (It will however hear my HT when I key it up from across the room)

So, if you have a PCR-100, 1000, or 1500 that you are thinking about selling, please let me know. You can contact me off-list at w2lie@...

Hi,

I'm wondering what is best usb to rs232 adapter, so I could use PCR-1000 with Windows 7 x64?

I've bought this http://url.ie/g197 and I have no idea what driver I should use.

I've tried following:
PL2303_Prolific_DriverInstaller_v1.7.0
CDM 2.08.24 WHQL Certified
US-232-11_windows
and CH341SER

no luck though :(

Hi,

Wasn☐t it written anything on the box what driver to use? Any cd in the box?

Have you checked the manufacturers website for drivers?

I use the Aten UC-232A and with that it was a cd included.

Best regards

That sounds like the problems I had when I had a counterfeit chipset.

The first thing you need is to know your chipset in the adapter, I think
you can find that via the Device Manager, probably easiest by getting
the USB VID/PID and searching google. Then you need to find the latest
driver for it and try to install it. If it fails there is a huge chance
it's a counterfeit chipset, especially if it's a Prolific(I got one from
fleabay that was counterfeit). Once I stopped using Windows and started
using Linux, all those driver issues went away so I haven't bothered
with it in a while.

Hi,

Thanks for this. Unfortunately device manager display this device as USB2.0-Serial and there's nothing else. The seller didn't come back to me with information regarding chipset nor driver.

Hi

That□s sad when supplied drivers don□t work. Maybe you should send it back
and replace it with a more known model.

You'll actually find it in the driver details tab of the device but I'm
not 100% sure how to tell you to find it. If the seller won't return
your email, that's probably a sign it's a counterfeit and you'll need to
find one with a real chipset. I paid almost $30 for mine locally so I
could be 100% certain it'd work. I didn't want to spend a lot of time
looking for something that might work and the extra money was worth it
to be listening within a few minutes.

Hi Eric,

Actually I bought two adapters. I thought that they're exacly the same. Apparently one seems to be fake. I paid few Euro so there is no point sending it back to the seller, however I'll let him know about this fact.
I downloaded PL203 drivers and all is fine.
Finally I can use my notebook and Icom using usb.

http://tinyurl.com/pcr-1000forsale

Eric I have the same opinion - sometimes it is better to pay more and don't worry about compatibility issues :)

Hello Everyone

I had a similar thing happen with my pcr-1000. We had a near hit during a thunderstorm. I was enough to make my PCR1000 almost deaf. I contacted a couple of Icom authorized service centers out here (NY state area) and got the cold shoulder. One shop just flat out said I won't look at anything that's a possible ESD problem. Icom are you listening? That's no way to keep customers. Even if the shops are independent, they do represent you. The good news is the center out in St. Joesph Michigan took the work on and did a great job repairing it. He knew the rig and told me that they are a little sensitive to ESD. I sent it out to him and while I don't have the bill in front of me as it was a little less than 2 years ago but, my memory was it was less than $150 with shipping. Well worth it. It's been fine ever since. I can't say enough good things about the service he provided. It was really clear to me that the shops out here want to do commercial radio repair and have no interest in working on Ham radios even if they say they do.

Just my 2 cents

I hope this helps

It is recommended that a USB to RS232 adapter for the PCR1000 has a FTDI chip.

Unfortunately Icom software won't scan multiple banks but TalkPCR will and it is free and it's a good program , not sure if it is available from the group files , but Google it .
If you have a problem getting it i can email it.

Looks a rather budget thing and there have been reports of devices that only identify as Profilic.
The vendor should have provided a driver disk from which to load the appropriate driver if your Windows 7 does not identify it and load something suitable. Check Ports (Com and LPT) in Device Manager to confirm.
Mine shows as a Profilic USB-to-Serial Comm Port (Com4) and for my PCR1000 the Port Settings are 9600, 8, None, 1.

If I want a lot of information (with options) about active and previous USB devices I use "USBdeview" found at

http://www.nirsoft.net/utils/usb_devices_view.html

Hope this helps.

Fred.

The Icom software does have its limitations and for a better "bells and whistles" experience try "Ham Radio Deluxe".
http://www.hrdsoftwarellc.com/

For small and practical I still like "IcomControl"
http://arachnoid.com/icomcontrol/index.html
(Superseded by "JRX" which I haven't tried yet)

Please do not reply on this board!

5975. ICOM prc woks with window 7

Yahoo group: PCR1000
Date: 2012-11-21 02:56:42 UTC
From: Gettiny By
Topic: 5975 Message: 5975

I have had the IC prc1000 for many year now. Installed the original software that runs the receiver of the internet from icom japan web page, It runs good, I am using window 7 home edition 64 bit. I used the program on windows 7 to ajust to a earlier version of window xp with sevice pack 2. It works good, I use serial to usb converter cable, the cable has a chip in it along with software that has to run on 64 bit. It works good, than I use a pre amp to receive better. Ihave used ham radio deluxe the computer it would crash and stop working. The receiver is still a good all around receiver but it still has some draw back. It may not cover anything above 1300, but I have found nothing up there to listen to. A good vertical hf antenna like antron 99 and a uhf/vhf cone antenna works great. I hope this helps

What is the difference between the older version prc 1000 and the newer model like prc 1500 and 2500, I know they use a usb cable and the rang runs from up ro 3000 range on the 1500/2500 models and some use a radio face to control it, do the newer model work better on the same range as the older prc 1000, What about the software for each unit did icom do a better job on on the new prc 1500/2500 than the it did on the prc 1000 unit. Thanhs

I have both the 1000 and the 1500.

To be honest from a performance point of view the 1500 is miles better than the 1000. I use the 1500 on a commercial site where there are high power pagers nearby plus other commercial users and the 1500 copes very well indeed with excellent immunity to out of band signals.

I had to use my 1500 for some work stuff a while back and so I put the 1000 in its place and it was nowhere near as good and suffered terribly from the pagers breakthrough and other problems / desense / blocking from the commercial stuff that I didnt ever have with the 1500.

Your mileage may very but thats my experience!

Matt

5979. TrunkPCR version 0.90.286 Now Available

Yahoo group: PCR1000
Date: 2012-12-19 03:04:55 UTC
From: Jay
Topic: 5979 Message: 5979

TrunkPCR version 0.90.286 Now Available for Downloading from the Homepage:
http://www.fiftyonefiftysystems.com/TrunkPcr/TrunkPcrDwnld.html

NOTE: Moto Type-I Support *should* be finished in the next major update.

This update has Six Fixes and One Addition...

Oct 12,2012 - Fixed: Setting CTCSS Tone Option as Normal instead of Reverse
when Importing a Bank from RadioReference Web Import.
Oct 12,2012 - Fixed: Changed link on PayPal picture in Donation Popup.
Oct 12,2012 - Added: RadioReference.com v10 update. (Bug Fix)
Dec 13,2012 - Fixed: Tracking ID SubScript Error.
Dec 15,2012 - Fixed: Stack OverFlow Error #28 in COM Routines.
Dec 16,2012 - Fixed: Wrong Frequency Displayed When Started with AFC ON.
Dec 17,2012 - Fixed: Error in Spectrum Sweep Print after Canceling.

Version 0.90.286 Released 12/18/2012

IMPORTANT: If you have Upgraded ICom's Program to Version 2.20, then you will need
to Check the [Ignore CTS] CheckBox in the COM Port Selector BEFORE Clicking the
[Power] Button...

Regards,
Jay

From: Ric
Topic: 5981 Message: 5981

Newbie here.....don't pick on me too much. I'm trying to learn about trunking systems.

I have a PCR-1000.

All of the RI Police Departments have gone to this P25 system :

http://www.radioreference.com/apps/db/?sid=4275

If I manually put in all the frequencies and talk groups, can I use TRUNKPCR to listen to them?

I think the answer is no because it is a P25 system but please correct me if I am wrong.

Thanks in advance!

From: Jay
Topic: 5981 Message: 5982

Hi Ric,

You are correct, TrunkPCR will not decode the P25 Audio by it self.
However, you can download DSD for Windows here:
"http://minus.com/mDdWS7LZK/"

Click the dsd 1.6.zip "Download (1.0 MB) link...

This will decode the P25 Audio from the PCR-1000's Packet Port.

For more info on DSD, check out the RadioReference.com Forums...

Regards,
Jay

From: Andrew
Topic: 5981 Message: 5983

Hi,

There's a page for DSD at:

http://wiki.radioreference.com/index.php/Digital_Speech_Decoder_%28software_package%29

But it seems all the windows binary links are dead, (for me, at least) including the one Jay mentioned - except the "Backup Site for Windows binaries" link seems to work.

I'm curious why there's only source for 1.4.1 available but Windows binaries for 1.6. I haven't checked the forums though, and I guess that shouldn't matter anyway if you're just using the windows binaries..

Cheers,

Andrew

Subject: Re: [PCR1000] Need some help please

Hi Ric,

You are correct, TrunkPCR will not decode the P25 Audio by it self.
However, you can download DSD for Windows here:
"http://minus.com/mDdWS7LZK/"

Click the dsd 1.6.zip "Download (1.0 MB) link...

This will decode the P25 Audio from the PCR-1000's Packet Port.

For more info on DSD, check out the RadioReference.com Forums...

Regards,
Jay

Topic: 5985 Message: 5986

Hi Cliff,

I use a Mac and run my PCR-1000 via VMware Fusion https://my.vmware.com/web/vmware/info/slug/desktop_end_user_computing/vmware_fusion/5_0 in which I installed XP Pro.

Previously I was running it with Parallels, but when Apple upgraded to Mountain Lion, Parallels used the occasion to screw all users for a hefty upgrade fee. Like many other Parallels users, we dumped Parallels and switched to VMware.

Your other option is to install your preferred compatible windows version in Bootcamp. Hope this helps.

Kind regards
Gemini

PS: Incidentally, this is my first post on this group. Merry Christmas to all :)

Hi WB6VSL,

I have 2 IC-PCR 1000's and would be quite willing to sell one.

c/w receiver, power supply, whip antenna, serial to USB cable, CD with software, mini-CD with USB drivers, manual. If you prefer serial to serial cable can easily purchase one. Great condition and fully functional.

You can contact me at grahameb@... to discuss price and payment.

Regards,

Hi Giovanni

There's quite a few links available via Google to a partial service manual, file size around 26MB, which is useful enough but not the best copy available.

For a better copy of the complete PCR1000 service manual try here.....

_http://rapidshare.com/files/3652857646/PCR1000_Service.pdf_
(http://rapidshare.com/files/3652857646/PCR1000_Service.pdf)

Good luck with the repair.

5993. PyPCR1000 under development again..

Yahoo group: PCR1000
Date: 2013-02-04 00:37:51 UTC
From: Eric Haddix
Topic: 5993 Message: 5993

For the past couple years I've been trying to get the original to work with my PCR-1000. Thinking it stopped working due to an update in PySerial, I didn't work on it much due to time constraints but last weekend I had a breakthrough that makes me wonder if it ever worked for anyone without massive fiddling. I can now, hopefully, claim it'll work for everyone.

My eventual goal is to expand its operation and put it on a Raspberry Pi as a "hardware" frontend. I already got proof of concept with a basic setup but next will be the hardware hacking.

Anyway, here's the working code if anyone wants to try it out.

Topic: 3871 Message: 5996

Unless you're just interested in the original whip antenna for the sake of "completeness" there probably isn't much point in looking for one

There's nothing special about it, it really is just a relatively short telescopic whip on the end of a length of coax and isn't very useful unless you're just looking for local broadcast signals, and fairly strong ones at that.

True dat. The supplied antenna is marginal and the only way to mount it is with the sticky tape that comes with it. Very clunky. What does work nicely is one of the small magmount bases with BNC, like the OPEK AM-109-BNC

http://www.americanradiosupply.com/opek-am-109-bnc-mini-magnetic-antenna-mount-8-ft-rg-174-bnc-male/

This allows you to use different types of rubber antennas or telescopic base or center loaded whips for HF.

"....Don't know yet which palm to use...."

If you mean Palm Pilot with IP1KC program, the Palm IIIc, M100, M105 and VIIx control the PCR1000 impressively well. Program from the files section and an adapter for the serial cable can be made with two DB9M connectors back-to-back.

Fred.

The supplied whip antenna is just that, a short whip on the end of a length
of co-ax.
There's nothing special about it and to all intents and purposes,
especially on HF, it's going to be pretty useless.

Before trying any other software it's always a good idea to start out with
Icom's software and at least make sure everything is up and running ok, if
only because that removes at least one "unknown" from the equation.
Third party software might, or might not, look a bit prettier, and might
offer some bells and whistles, but it's not going to produce signals by
magic if you can't hear them to start with.

If you're not looking to string long lengths of wire for HF then you
probably need some form of active antenna, although a passive tuned loop might
also be ok for limited bandwidth.

If you're into DIY then the active mini-whip design from PA0RDT can be
built for next to nothing and is a great performer from LF up to 20MHz plus.
Usual interference sensitivity of any active whip antenna applies but still
one I can highly recommend. Plenty of info online if you do a Google search.

Still at a very reasonable cost is this Ebay item for a kit of parts
including PCB for the mini-whip, 121063166753, and if you've got the components
the same seller has other auctions even cheaper for just the PCB.
I have no connection with the seller other than I bought a couple of these
last year and was very happy with them.

Regards

Nigel

There is not a better sub $600 wideband all mode receiver than the
PCR-1000. Excellent buy!

6009. PCR1000 vs PCR2500

Yahoo group: PCR1000
Date: 2013-02-14 07:19:51 UTC
From: Paolo Sfriso
Topic: 6009 Message: 6009

Dear Friends.

I recently traded-in my PCR1000 for a PCR2500 (I was interested in the 2,4GHz coverage and dual monitoring options).

While no longer having the PCR1000, I have developed the impression of 2 come-downs with the PCR2500: first its' practically deaf below 500kHz (despite being connected to a discone, the PCR1000 provided quite good LF reception), second its' audio quality seems to be slightly worse (audio reproduction seems to be slightly clipped/metallic).

The antenna (discone) is the same, the PC is the same and the software is the same (TalkPCR).

Any suggestions ?

Kind Regards.

Paolo I3-72945

Hi Alan,

I've just checked the couple of versions of PCR1000BUR in my PCR archives,
I would probably have downloaded these ten or twelve years ago, and
there's no documentation with either of them, so I'm wondering if there ever was.

I can't remember now if I ever installed either of them, again it would
have been ten or twelve years ago if I did, have you tried installing a copy
to see if it comes with a built in help file?

PC1000BUR was/is a program writtten by Patrick Masotta for backing up and restoring the EEPROM calibration data in the PCR1000 to allow a corrupted EEPROM to be restored without needing to send the radio back to Icom.

It also allowed some EEPROM parameters to be edited and recalibrated.

In order to refresh my memory I've just installed my copy of PCR1000BUR 1v2 and as I suspected there is a help file/manual built into the program.

There were other Backup/Restore programs, one at least of which came with a default EEPROM data file as a sort of "Get out of jail free card" for those who didn't have a backup of their own data, but I don't seem to have copies of any of these anymore.

There's a copy of PCR1000BUR 1v2 in the group files section. It's not the copy I installed so can't vouch for it but I'm sure it will be ok.
The software won't run if it doesn't find a PCR1000 to connect to, not even to allow the manual to be read.

I do remember now using this software before when I had my first PCR1000 and I've just used it to make an EEPROM backup of my current receiver, which is a very quick and easy process.
I generally use Icom's own control software, and Icom always insisted, in the past anyway, that an EEPROM could only become corrupted through using third party software, well the would wouldn't they:-), but there's no harm in having some insurance.

As an extra "bonus" I see from the manual that there's also an option to specify the "country code" when reinstalling the data so a possible instant coverage upgrade for some:-)

From: Patrick Masotta
Topic: 6011 Message: 6015

Hi
I wrote PCR1000BUR some time ago;
yes the info on how to use it is within the program.
I remember the default parameters where taken from the statistic gathered from people's backup files.
There's only one parameter (frequency offset) that presented a huge dispersion then setting that from a default set of values will sure lead to problems.
For fixing that parameter the program included a module of FFT that help you to quickly and accurately calibrate the receiver frequency when tuning a standard frequency from a couple of satellites,... I'm pulling this out of my memory, everything is well explained within the software.

Best,
Patrick

PC1000BUR was/is a program writtten by Patrick Masotta for backing up and

It takes talent to write such a program and PCR1000BUR looks intriguing.
Especially the implication of Nigel's observation about setting the "country code".

Does this mean that after backing up a cellular blocked US version PCR1000, if the country code is changed then the EEPROM contents restored, unrestricted frequency coverage becomes possible?

Regards,

Fred.

As an extra "bonus" I see from the manual that there's also an
option to specify the "country code" when reinstalling the data so a possible
instant coverage upgrade for some:-)

Hi Fred

The answer to your question is YES and/or NO, depending on the age of your receiver.

From the very earliest days of the PCR1000 attempts were made to open up the restricted cellular bands on the US version.
The first "solution", although I'm still not sure just how well this worked, or even if it did work, was a hardware mod that involved, as best I recall, swapping around some coding diodes and possibly other changes.

It was eventually revealed though that the "different" hardware versions were actually identical but with a country/region specific code programmed into the onboard firmware.
As a result several programs appeared that would allow changing the country code to remove the restrictions, I know changing from USA to Europe/Australia would allow unrestricted coverage but not sure about other areas now.

Unfortunately, the FCC was very unhappy about this and insisted that Icom change the design to inhibit such changes, and that's what they did, so the software mod does not work on later production.

I don't know the exact serial number where it changed, but I think somewhere around 3500, and at guess I would say that any PCR1000 made after 2000 is probably too recent to be modified.

I don't know whether or not PCR1000BUR might allow a temporary change for as long as the set is kept on say, my set is already an Eur/Aus receiver anyway and I don't have the courage to try changing it to anything else:-), but certainly the permanent region change was no longer possible on later sets.

Given the eventual encryption of cellular signals there's probably very little to be gained from it these days anyway, other than perhaps just personal satisfaction of being able to do so:-)

regards

Nigel

Subject: Re: [PCR1000] Pcr 1000bur user guide

Hi
I wrote PCR1000BUR some time ago;
yes the info on how to use it is within the program.
I remember the default parameters where taken from the statistic gathered from people's backup files.
There's only one parameter (frequency offset) that presented a huge dispersion then setting that from a default set of values will sure lead to problems.
For fixing that parameter the program included a module of FFT that help you to quickly and accurately calibrate the receiver frequency when tuning a standard frequency from a couple of satellites,... I'm pulling this out of my memory, everything is well explained within the software.

Best,
Patrick

PC1000BUR was/is a program writtten by Patrick Masotta for backing up and restoring the EEPROM calibration data in the PCR1000 to allow a corrupted EEPROM to be restored without needing to send the radio back to Icom.

It also allowed some EEPROM parameters to be edited and recalibrated.

In order to refresh my memory I've just installed my copy of PCR1000BUR 1v2 and as I suspected there is a help file/manual built into the program.

There were other Backup/Restore programs, one at least of which came with a default EEPROM data file as a sort of "Get out of jail free card" for those who didn't have a backup of their own data, but I don't seem to have copies of any of these anymore.

There's a copy of PCR1000BUR 1v2 in the group files section. It's not the copy I installed so can't vouch for it but I'm sure it will be ok.
The software won't run if it doesn't find a PCR1000 to connect to, not even to allow the manual to be read.

I do remember now using this software before when I had my first PCR1000 and I've just used it to make an EEPROM backup of my current receiver, which is a very quick and easy process.
I generally use Icom's own control software, and Icom always insisted, in the past anyway, that an EEPROM could only become corrupted through using

third party software, well the would wouldn't they:-), but there's no harm
in having some insurance.

As an extra "bonus" I see from the manual that there's also an option to
specify the "country code" when reinstalling the data so a possible instant
coverage upgrade for some:-)

Thanks Nigel,
Quite agree and I've often wondered why e-bay (etc) values should be higher for unrestricted versions of PCR1000 and other gear when there seems no practical advantage.
But I had to ask.
Mine's full coverage with quite a low serial number (bought with one of the first available UT106) - very reliable and if I ever do sell it I'll be sure to mention this "feature"!

:-)

Thanks Patrick,
I sometimes more enjoy getting things to work too :-)
Never had cause to fix my PCR1000 but followed temptation, installed and ran your program, backed up and compared the EEPROM successfully.

However, I was surprised that the EEPROM Analysis showed Crashed Pattern Matching = 99%, Values Out of Statistical Margins = 93%,Reference Frecuency Value = 128.

Following the "Advice: Your EEPROM shows the Crash Pattern, please apply an Smart Set Average Data" resulted in the EEPROM content being modified without warning and "Ref. Xtal Freq. Adj." required.

I then decided to exit, play safe and restored the EEPROM content to original.

The radio appears to operate as before but would you know ifanything might have changed that I should consider?

Also, would the program be valid for later serial number PCR1000s as well as earlier (like mine)?

Hi Fred

You got me intrigued, so after running a compare to ensure my backup was still ok I tried the same thing, my serial number is 09148 but I don't know whether or not that qualifies as "later"

I got a Crashed Pattern Matching of 13%, Values Out of Statistical margins = 11, Reference Frequency Value of 103, and the same recommendation to apply the Smart Set Average Data.

Rather than do that I chose the "File View" option for both my backed up data and for the Smart Set Average Data and copied the results into Wordpad so I could compare them.

Although I could see variations between my data and the "Average" data, to the naked eye at least these didn't look too bad, I haven't checked actual percentage variations as yet, and some data looks to be fixed anyway, with a confidence error of zero and also appearing in the Crashed Pattern data, so it looks as though some Crashed Pattern matching might be inevitable unless these are deliberately excluded from the comparison.

Looking at just how extreme most of the Crash Pattern figures are though it does seem rather odd that your working receiver should show a 99% match, especially as I'm assuming this set of values is taken from one or more actual crashed receivers.

If you haven't already done so it might be an interesting exercise to use the File View options on your files to check just how different from the Average data your values really are, and also how similar to the crashed data. I can also send you a copy of my data file for comparison if that would help.

I'm assuming that the Average Data is just that, data averaged from data files submitted by a number of users and reflecting how the radios were set up to start with and any subsequent drift, although I guess the majority of sets wouldn't have been old enough at the time to have drifted too much anyway.

It's just occurred to me, not that I'm slow or anything:-), that one advantage of Patrick's use of average data and statistical analysis is not needing to know what the data in any given EEPROM location actually relates to. And sure enough, whilst a Google search brings up plenty of references to backing up and restoring the EEPROM I've not found anything so far to suggest what might be stored where.

However, in terms of analysing the differences it would be interesting to have this information, so if anyone does have it, Patrick perhaps?, a copy

would be much appreciated.

Regards

Nigel

I remember there was a pattern for the crashed PCR1000,
I wonder how your receiver works well if it has the values so identical to the crashed pattern? it's very weird...

Of course all my statistical model was based on the early production units, I really do not know if things changed on the memory mappings; but it is still weird how close to the crashed pattern your values are...

you could very well apply the "smart set" of course you need to adjust the frequency as that parameter had very high deviation. Then if you do not like it you can restore your values from your back-up. I did it million times on my unit and I never crashed it once.

I have a pretty good record of more than 10 years with no-one telling me that crashed his box because of my soft ;-)))

Completing a bit the story, yes the initial mod was a comparing the different PCBs. The only difference were some surface mounted "resistors" operating as switches giving a hardware configuration. Next some Icom internal software leaked and the rest was easy... ;-)

Best,
Pat

Thanks Patrick,
I sometimes more enjoy getting things to work too :-)
Never had cause to fix my PCR1000 but followed temptation, installed and ran your program, backed up and compared the EEPROM successfully.

However, I was surprised that the EEPROM Analysis showed Crashed Pattern Matching = 99%, Values Out of Statistical Margins = 93%, Reference Frecuency Value = 128.
Following the "Advice: Your EEPROM shows the Crash Pattern, please apply an Smart Set Average Data" resulted in the EEPROM content being modified without warning and "Ref. Xtal Freq. Adj." required.
I then decided to exit, play safe and restored the EEPROM content to original.
The radio appears to operate as before but would you know if anything might have changed that I should consider?
Also, would the program be valid for later serial number PCR1000s as well as earlier (like mine)?

Regards,
Fred.

It takes talent to write such a program and PCR1000BUR looks intriguing.Especially the implication of Nigel's observation about setting the "country code".
Does this mean that after backing up a cellular blocked US version PCR1000, if the country code is changed then the EEPROM contents restored, unrestricted frequency coverage becomes possible?
Regards,
Fred.

Subject: Re: [PCR1000] Pcr 1000bur user guide

Hi
I wrote PCR1000BUR some time ago;
yes the info on how to use it is within the program.
I remember the default parameters where taken from the statistic gathered from people's backup files.
There's only one parameter (frequency offset) that presented a huge dispersion then setting that from a default set of values will sure lead to problems.
For fixing that parameter the program included a module of FFT that help you to quickly and accurately calibrate the receiver frequency when tuning a standard frequency from a couple of satellites,... I'm pulling this out of my memory, everything is well explained within the software.

Best,
Patrick

PC1000BUR was/is a program writtten by Patrick Masotta for backing up and
restoring the EEPROM calibration data in the PCR1000 to allow a corrupted EEPROM
to be restored without needing to send the radio back to Icom.

It also allowed some EEPROM parameters to be edited
and recalibrated.

In order to refresh my memory I've just installed my copy of PCR1000BUR 1v2
and as I suspected there is a help file/manual built into the program.

There were other Backup/Restore programs, one at least of which came with a
default EEPROM data file as a sort of "Get out of jail free card" for those who
didn't have a backup of their own data, but I don't seem to have copies of
any of these anymore.

There's a copy of PCR1000BUR 1v2 in the group files section. It's not the
copy I installed so can't vouch for it but I'm sure it will be ok.
The software won't run if it doesn't find a PCR1000 to connect to, not even
to allow the manual to be read.

I do remember now using this software before when I had my first PCR1000
and I've just used it to make an EEPROM backup of my current receiver,
which is a very quick and easy process.
I generally use Icom's own control software, and Icom always insisted, in
the past anyway, that an EEPROM could only become corrupted through using third
party software, well the would wouldn't they:-), but there's no harm in having
some insurance.

As an extra "bonus" I see from the manual that there's also an
option to specify the "country code" when reinstalling the data so a possible
instant coverage upgrade for some:-)

Hi Fred

You got me intrigued, so after running a compare to ensure my backup was
still ok I tried the same thing, my serial number is 09148 but I don't know
whether or not that qualifies as "later"

I got a Crashed Pattern Matching of 13%, Values Out of Statistical margins
= 11, Reference Frequency Value of 103, and the same recommendation to apply the
Smart Set Average Data.

Rather than do that I chose the "File View" option for both my backed
up data and for the Smart Set Average Data and copied the results into
Wordpad so I could compare them.

Although I could see variations between my data and the "Average" data, to
the naked eye at least these didn't look too bad, I haven't checked actual
percentage variations as yet, and some data looks to be
fixed anyway, with a confidence error of zero and also appearing in the
Crashed Pattern data, so it looks as though some Crashed Pattern
matching might be inevitable unless these are deliberately excluded from the
comparison.

Looking at just how extreme most of the Crash Pattern figures are
though it does seem rather odd that your working receiver should
show a 99% match, especially as I'm assuming this set of values is
taken from one or more actual crashed receivers.

If you haven't already done so it might be an interesting exercise to use
the File View options on your files to check just how different from the Average
data your values really are, and also how similar to the crashed data. I can
also send you a copy of my data file for comparison if that would help.

I'm assuming that the Average Data is just that, data averaged from data
files submitted by a number of users and reflecting how the radios
were set up to start with and any subsequent drift, although I guess the
majority of sets wouldn't have been old enough at the time to have drifted too

much anyway.

It's just occurred to me, not that I'm slow or anything:-), that one advantage of Patrick's use of average data and statistical analysis is not needing to know what the data in any given EEPROM location actually relates to.
And sure enough, whilst a Google search brings up plenty of references to backing up and restoring the EEPROM I've not found anything so far to suggest what might be stored where.

However, in terms of analysing the differences it would be interesting to have this information, so if anyone does have it, Patrick perhaps?, a copy would be much appreciated.

0056 :     144     144     144     144     144     144     144     144
0064 :     144     144     144     144     144     144     144     144
0072 :     144     144     144     144     144     144     144     144
0080 :     144     144     144     144     144     0     0     0
0088 :     128     128     128     128     128     128     128     128
0096 :     128     128     128     128     128     128     128     128
0104 :     128     128     128     128     128     128     128     128
0112 :     128     128     128     128     128     128     128     128
0120 :     128     128     128     128     128     0     2     2
```

My receiver serial number is in the 02300 range so would be concurrent with when you wrote your program. It's encouraging that it has proved reliable over 10 years or more. If being developed and you had been looking for feedback I would have suggested that content and frequency adjustment should not begin without warnings.

Can you clarify your meaning of "crashed", what the "smart set" is, the simplest way possible to "adjust the frequency" and is the above what the pattern typically becomes?

Meantime, I'll search for an EEPROM backup done with another program and see if/how it differs. Hopefulluy any corruption occurred after I made that backup.
It is interesting that in gereral usage nothing indicated any strangenesses until today!

Regards,

Fred.

From: Fred
Topic: 6011 Message: 6028

Hi Nigel,

Your radio is certainly much later than mine. I must admit wishing the smart set average data hadn't been applied and I don't have access to a good frequency counter these days - but let's see what can be done.

It's easy enough to copy my backed up contents (see them in my answer to Patrick) and despite what they may indicate, the receiver is showing no obvious problems - albeit after brief testing.

It's a good long time since Patrick wrote his program and I hope he doesn't find this resurgence of interest inconvenient!

:-)

Fred.

>Hi Fred
>You got me intrigued, so after running a compare to ensure my backup was
still ok I tried the same thing, my serial number is 09148 but I don't know
whether or not that qualifies as "later"
>
>I got a Crashed Pattern Matching of 13%, Values Out of Statistical margins
= 11, Reference Frequency Value of 103, and the same recommendation to apply the
Smart Set Average Data.
>
>Rather than do that I chose the "File View" option for both my backed
up data and for the Smart Set Average Data and copied the results into
Wordpad so I could compare them.
>
>Although I could see variations between my data and the "Average" data, to
the naked eye at least these didn't look too bad, I haven't checked actual
percentage variations as yet, and some data looks to be
fixed anyway, with a confidence error of zero and also appearing in the
Crashed Pattern data, so it looks as though some Crashed Pattern
matching might be inevitable unless these are deliberately excluded from the
comparison.
>

>Looking at just how extreme most of the Crash Pattern figures are
though it does seem rather odd that your working receiver should
show a 99% match, especially as I'm assuming this set of values is
taken from one or more actual crashed receivers.
>
>If you haven't already done so it might be an interesting exercise to use
the File View options on your files to check just how different from the Average
data your values really are, and also how similar to the crashed data. I can
also send you a copy of my data file for comparison if that would help.
>
>I'm assuming that the Average Data is just that, data averaged from data
files submitted by a number of users and reflecting how the radios
were set up to start with and any subsequent drift, although I guess the
majority of sets wouldn't have been old enough at the time to have drifted too
much anyway.
>
>It's just occurred to me, not that I'm slow or anything:-), that one
advantage of Patrick's use of average data and statistical analysis is not
needing to know what the data in any given EEPROM location actually
relates to.
>And sure enough, whilst a Google search brings up plenty of references to
backing up and restoring the EEPROM I've not found anything so far to
suggest what might be stored where.
>
>However, in terms of analysing the differences it would be interesting to
have this information, so if anyone does have it, Patrick perhaps?, a copy
would be much appreciated.

6029. Re: [PCR1000] Pcr 1000bur user guide

Yahoo group: PCR1000
Date: 2013-03-02 02:10:43 UTC
From: Fred
Topic: 6011 Message: 6029

Hi Patrick,

Further to my last, I have restored EEPROM contents with BAKPCR and my initial backup file of June 1996 - so now the contents are.....

File: PCR1000.DAT Date: 02/03/2013
Back Up Data.

```
0000 :     0     0     82     88     133     0     0     0
0008 :     73     90     105     128     152     176     199     220
0016 :     59     74     87     110     133     160     182     204
0024 :     21     39     45     52     56     59     62     64
0032 :     20     55     115     146     11     11     2     4
0040 :     0     0     96     160     108     150     122     116
0048 :     133     138     137     144     145     147     150     148
0056 :     126     129     128     131     127     124     124     119
0064 :     135     129     132     136     132     132     128     128
0072 :     127     124     112     118     119     119     129     128
0080 :     132     132     123     122     121     0     0     0
0088 :     35     37     118     112     116     191     196     211
0096 :     74     47     120     105     97     184     179     185
0104 :     45     33     113     95     81     155     133     113
0112 :     189     187     74     63     53     142     74     156
0120 :     116     190     121     199     164     0     2     2
```

Which seems more reasonable.

Will think about how best to check frequency accuracy after I sleep!

:-)

Fred.

Hi Fred

That certainly looks a lot closer to Patrick's average data, just as well you took the earlier backup, I wonder what caused it to change so much.

It's certainly a warning to all of us that backing up the EEPROM still isn't something to be ignored and I'm feeling much more at ease knowing I've done mine.

I was doing a bit more searching todfay and came across this page........

_http://geophysics.ou.edu/home/pcr1000/backup_eeprom.html_
(http://geophysics.ou.edu/home/pcr1000/backup_eeprom.html)

There's some reports on there that show EEPROM results from 14 different PCR1000s and also a calculated average for each location, which are encouragingly similar to Patrick's average values:-)

There's also the indication I was looking for of what each location represents and whilst some are just shown as "reserved", most seem to be reference levels for the S meter and band pass filter tuning points which might explain why a receiver showing very close to the crash pattern, as yours was, could still appear fully functional if nothing more critical had been affected.

Regards

Nigel

Subject: Re: [PCR1000] Pcr 1000bur user guide

Hi Patrick,

Yes - it does seems odd but general functionality and reception appears to
be maintained, the receiver finds stored frequencies yet the EEPROM
contents are ......
File: PCR1000.DAT Date: 01/03/2013
Back Up Data.

0000 : 0 0 82 88 128 0 0 0
0008 : 0 48 80 112 144 176 208 240
0016 : 0 48 80 112 144 176 208 240
0024 : 0 48 80 112 144 176 208 240
0032 : 115 146 115 146 166 36 0 0
0040 : 0 0 96 160 144 144 144 144
0048 : 144 144 144 144 144 144 144 144
0056 : 144 144 144 144 144 144 144 144
0064 : 144 144 144 144 144 144 144 144
0072 : 144 144 144 144 144 144 144 144
0080 : 144 144 144 144 144 0 0 0
0088 : 128 128 128 128 128 128 128 128
0096 : 128 128 128 128 128 128 128 128
0104 : 128 128 128 128 128 128 128 128
0112 : 128 128 128 128 128 128 128 128
0120 : 128 128 128 128 128 0 2 2

My receiver serial number is in the 02300 range so would be concurrent
with when you wrote your program. It's encouraging that it has proved
reliable over 10 years or more. If being developed and you had been looking for

feedback I would have suggested that content and frequency adjustment should not begin without warnings.

Can you clarify your meaning of "crashed", what the "smart set" is, the simplest way possible to "adjust the frequency" and is the above what the pattern typically becomes?

Meantime, I'll search for an EEPROM backup done with another program and see if/how it differs. Hopefulluy any corruption occurred after I made that backup.
It is interesting that in gereral usage nothing indicated any strangenesses until today!

Regards,

Fred.

Subject: Re: [PCR1000] Pcr 1000bur user guide

I remember there was a pattern for the crashed PCR1000,
I wonder how your receiver works well if it has the values so identical to the crashed pattern? it's very weird...

Of course all my statistical model was based on the early production units, I really do not know if things changed on the memory mappings; but it is still weird how close to the crashed pattern your values are...

you could very well apply the "smart set" of course you need to adjust the frequency as that parameter had very high deviation. Then if you do not like it you can restore your values from your back-up. I did it million times on my unit and I never crashed it once.

I have a pretty good record of more than 10 years with no-one telling me that crashed his box because of my soft ;-)))

Completing a bit the story, yes the initial mod was a comparing the different PCBs. The only difference were some surface mounted "resistors" operating as switches giving a hardware configuration. Next some Icom internal software leaked and the rest was easy... ;-)

Best,
Pat

Sent: Friday, 1 March 2013, 8:46
Subject: Re: [PCR1000] Pcr 1000bur user guide

Hi
I wrote PCR1000BUR some time ago;
yes the info on how to use it is within the program.
I remember the default parameters where taken from the statistic gathered from people's backup files.
There's only one parameter (frequency offset) that presented a huge dispersion then setting that from a default set of values will sure lead to problems.
For fixing that parameter the program included a module of FFT that help you to quickly and accurately calibrate the receiver frequency when tuning a standard frequency from a couple of satellites,... I'm pulling this out of my memory, everything is well explained within the software.

Best,
Patrick

PC1000BUR was/is a program writtten by Patrick Masotta for backing up and restoring the EEPROM calibration data in the PCR1000 to allow a corrupted EEPROM to be restored without needing to send the radio back to Icom.

It also allowed some EEPROM parameters to be edited and recalibrated.

In order to refresh my memory I've just installed my copy of PCR1000BUR 1v2 and as I suspected there is a help file/manual built into the program.

There were other Backup/Restore programs, one at least of which came with a default EEPROM data file as a sort of "Get out of jail free card" for those who didn't have a backup of their own data, but I don't seem to have copies of any of these anymore.

There's a copy of PCR1000BUR 1v2 in the group files section. It's not the copy I installed so can't vouch for it but I'm sure it will be ok.
The software won't run if it doesn't find a PCR1000 to connect to, not even to allow the manual to be read.

I do remember now using this software before when I had my first PCR1000 and I've just used it to make an EEPROM backup of my current receiver, which is a very quick and easy process.
I generally use Icom's own control software, and Icom always insisted, in the past anyway, that an EEPROM could only become corrupted through using third party software, well the would wouldn't they:-), but there's no harm in having some insurance.

As an extra "bonus" I see from the manual that there's also an option to specify the "country code" when reinstalling the data so a possible instant coverage upgrade for some:-)

Hi Fred

You got me intrigued, so after running a compare to ensure my
backup was still ok I tried the same thing, my serial number is 09148
but I don't know whether or not that qualifies as "later"

I got a Crashed Pattern Matching of 13%, Values Out of
Statistical margins = 11, Reference Frequency Value of 103, and the
same recommendation to apply the Smart Set Average Data.

Rather than do that I chose the "File View" option for both
my backed up data and for the Smart Set Average Data and copied
the results into Wordpad so I could compare them.

Although I could see variations between my data and the "Average"
data, to the naked eye at least these didn't look too bad, I haven't
checked actual percentage variations as yet, and some
data looks to be fixed anyway, with a confidence error of
zero and also appearing in the Crashed Pattern data, so
it looks as though some Crashed Pattern matching might be inevitable
unless these are deliberately excluded from the comparison.

Looking at just how extreme most of the Crash Pattern
figures are though it does seem rather odd that your working
receiver should show a 99% match, especially as I'm assuming
this set of values is taken from one or more actual crashed
receivers.

If you haven't already done so it might be an interesting
exercise to use the File View options on your files to check just how
different from the Average data your values really are, and also how
similar to the crashed data. I can also send you a copy of my data
file for comparison if that would help.

I'm assuming that the Average Data is just that, data averaged
from data files submitted by a number of users and reflecting how
the radios were set up to start with and any subsequent drift,
although I guess the majority of sets wouldn't have been old enough at
the time to have drifted too much anyway.

It's just occurred to me, not that I'm slow or
anything:-), that one advantage of Patrick's use of average data
and statistical analysis is not needing to know what the data
in any given EEPROM location actually relates to.
And sure enough, whilst a Google search brings up plenty of
references to backing up and restoring the EEPROM I've not found
anything so far to suggest what might be stored where.

However, in terms of analysing the differences it would be
interesting to have this information, so if anyone does have it,
Patrick perhaps?, a copy would be much appreciated.

Regards

Nigel

There's only one
parameter (frequency offset) that presented a huge
dispersion then setting that from a default set of
values will sure lead to problems.
For fixing
that parameter the program included a module of
FFT that help you to quickly and accurately
calibrate the receiver frequency when tuning a
standard frequency from a couple of satellites,...
I'm pulling this out of my memory, everything is
well explained within the
software.

Best,
Patrick

PC1000BUR was/is a program
writtten by Patrick Masotta for backing up and
restoring the EEPROM calibration data in the
PCR1000 to allow a corrupted EEPROM to be
restored without needing to send the radio back
to Icom.

It also allowed some EEPROM parameters to
be edited and recalibrated.

In order to refresh my memory I've just
installed my copy of PCR1000BUR 1v2 and as I
suspected there is a help file/manual built into
the program.

There were other Backup/Restore programs,
one at least of which came with a default EEPROM
data file as a sort of "Get out of jail free
card" for those who didn't have a backup of
their own data, but I don't seem to have copies
of any of these anymore.

There's a copy of PCR1000BUR 1v2 in the
group files section. It's not the copy I
installed so can't vouch for it but I'm sure it
will be ok.
The software won't run if it doesn't find a
PCR1000 to connect to, not even to allow the
manual to be read.

I do remember now using this software
before when I had my first PCR1000 and I've just
used it to make an EEPROM backup of my
current receiver, which is a very quick and
easy process.
I generally use Icom's own control

software, and Icom always insisted, in the past anyway, that an EEPROM could only become corrupted through using third party software, well the would wouldn't they:-), but there's no harm in having some insurance.

As an extra "bonus" I see from the manual that there's also an option to specify the "country code" when reinstalling the data so a possible instant coverage upgrade for some:-)

```

My receiver serial number is in the 02300 range so would be concurrent with when you wrote your program. It's encouraging that it has proved reliable over 10 years or more. If being developed and you had been looking for feedback I would have suggested that content and frequency adjustment should not begin without warnings.

As far as I recall the frequency was a manual adjustment... but you are probably right, PCR100BUR was more than 12 years ago and I did it in 20 days ;-)

Can you clarify your meaning of "crashed",
The EEPROM might have internally some CRC location then the unit before reading its data verifies the CRC, if it finds a not matching CRC the unit initialize the EEPROM with...your values hahahha ;-) I mean a set of values easily recognized and most of the time leading to

a dead unit.

what the "smart set" is,
In case of a detected crash instead of filling the EEPROM with crazy default values I define a new set of default values gathered from the statistic of people's backup for those values presenting low standard deviation.

the simplest way possible to "adjust the frequency"
Frequency was the only parameter that having a huge standard deviation was not included in the smart set. Then I added a graphic FFT (Fast Fourier Transform) application that tuning in a side band of a standard frequency emitted for some satellites that I do not remember now and connecting the receiver audio output to the mic input in your computer should display a perfect like on the mark of the 1KHz on the FFT screen, very easy, simple, accurate, and very immune to noise. Of course this method considers the natural maximum deviation is not too big if not you'll never recognize where the satellite mark really is.

 and is the above what the pattern typically
becomes?
Yours by all means is a crashed pattern...

Meantime, I'll search for an EEPROM backup done with another program and see if/how it differs. Hopefulluy any corruption occurred after I made that backup.It is interesting that in gereral usage nothing indicated any strangenesses until today!

It's very weird...
Best,
Pat

Hi Patrick,

Further to my last, I have restored EEPROM contents with BAKPCR and my initial backup file of June 1996 - so now the contents are.....
File: PCR1000.DAT Date: 02/03/2013
Back Up Data.

0000 : 0 0 82 88 133 0 0 0
0008 : 73 90 105 128 152 176
 199 220
0016 : 59 74 87 110 133 160 182 204
0024 : 21 39 45 52 56 59 62 64
0032 : 20 55 115 146 11 11 2 4
0040 : 0 0 96 160 108 150 122 116
0048
: 133 138 137 144 145 147 150 148
0056 : 126 129 128 131 127 124 124 119
0064 : 135 129 132 136 132 132 128 128
0072 : 127 124 112 118 119 119 129 128
0080 :
 132 132 123 122 121 0 0 0
0088 : 35 37 118 112 116 191 196 211
0096 : 74 47 120 105 97 184 179 185
0104 : 45 33 113 95 81 155 133 113
0112 : 189
 187 74 63 53 142 74 156
0120 : 116 190 121 199 164 0 2 2

Which seems more reasonable.
Will think about how best to check frequency accuracy after I sleep!

:-)

didn't have a backup of their own data, but I don't seem to have copies of
any of these anymore.

There's a copy of PCR1000BUR 1v2 in the group files section. It's not the
copy I installed so can't vouch for it but I'm sure it will be ok.
The software won't run if it doesn't find a PCR1000 to connect to, not even
to allow the manual to be read.

I do remember now using this software before when I had my first PCR1000
and I've just used it to make an EEPROM backup of my current receiver,
which is a very quick and easy process.
I generally use Icom's own control software, and Icom always insisted, in
the past anyway, that an EEPROM could only become corrupted through using third
party software, well the would wouldn't they:-), but there's no harm in having
some insurance.

As an extra "bonus" I see from the manual that there's also an
option to specify the "country code" when reinstalling the data so a possible
instant coverage upgrade for some:-)

Hi Alan,

I've just checked the couple of versions of PCR1000BUR in my PCR
archives, I would probably have downloaded these ten or
twelve years ago, and there's no documentation with either of them, so I'm
wondering if there ever was.

I can't remember now if I ever installed either of
them, again it would have been ten or twelve years ago if I
did, have you tried installing a copy to see if it comes with a built in
help file?

Hi Patrick,

Indeed - and beyond not wrong, awareness resulted in identifying and correcting a problem that had amazingly gone unnoticed!

I'll take a squint at the FFT method when my Biorhythm graph peaks ;-)

:-)

Fred.

Hi Patrick,

That's very helpful detail and I'll save what you and Nigel have advised in a text file as solid reference.

Thank you!

:-)

Fred.

6037. Re: [PCR1000] Pcr 1000bur user guide

Yahoo group: PCR1000
Date: 2013-03-02 23:17:10 UTC
From: Fred
Topic: 6011 Message: 6037

Hi Nigel,

Too right about backing up.
As a long term believer I back up anything needing backing up.
Then I backup up the backed-up backup! :-)

The EEPROM content was saved as soon as I became aware of BACKPCR around June 1996 and several further backups since may indicate when the data became corrupted. I go through phases of interest in listening and it may well have resulted from experimenting recently with PCR1000 programs that mainly didn't run well on Puppy Linux and Wine on a flash drive.

Following your link and interpretation credibly explains why my PCR1000 showed no dramatic change in performance. Bandscope and S meter sensitivity were reduced but not greatly, I didn't observe odd AFC problems and operation was not obviously impaired. I suspect that if my "crashed" EPROM content were loaded to another PCR1000 the result could be similar.

What I now observe is that Bandscope amplitude is increased by perhaps a third, indicated signal strength is a couple of S points higher on favourite local broadcast stations and displayed frequency accuracy is within a few hertz of zerobeat on USB/LSB.

So far, so good :-)

Fred.

>Hi Fred
>That certainly looks a lot closer to Patrick's average data, just as well
you took the earlier backup, I wonder what caused it to change so much.
>
>It's certainly a warning to all of us that backing up the EEPROM still
isn't something to be ignored and I'm feeling much more at ease knowing I've
done mine.
>
>I was doing a bit more searching todfay and came across this
page........
>
>http://geophysics.ou.edu/home/pcr1000/backup_eeprom.html
>
>There's some reports on there that show EEPROM results from 14
different PCR1000s and also a calculated average for each location, which

are encouragingly similar to Patrick's average values:-)
>
>There's also the indication I was looking for of what each location
represents and whilst some are just shown as "reserved", most seem to be
reference levels for the S meter and band pass filter tuning points which might
explain why a receiver showing very close to the crash pattern, as yours was,
could still appear fully functional if nothing more critical had been
affected.

As a long term believer I back up anything needing backing up.
Then I backup up the backed-up backup! :-)

The EEPROM content was saved as soon as I became aware of BACKPCR around June 1996 and several further backups since may indicate when the data became corrupted. I go through phases of interest in listening and it may well have resulted from experimenting recently with PCR1000 programs that mainly didn't run well on Puppy Linux and Wine on a flash drive.

Following your link and interpretation credibly explains why my PCR1000 showed no dramatic change in performance. Bandscope and S meter sensitivity were reduced but not greatly, I didn't observe odd AFC problems and operation was not obviously impaired. I suspect that if my "crashed"
EPROM content were loaded to another PCR1000 the result could be similar.

What I now observe is that Bandscope amplitude is increased by perhaps a third, indicated signal strength is a couple of S points higher on favourite local broadcast stations and displayed frequency accuracy is within a few hertz of zerobeat on USB/LSB.

So far, so good :-)

Fred.

Hi Fred

That certainly looks a lot closer to Patrick's average data, just as well
you took the earlier backup, I wonder what caused it to change so much.

It's certainly a warning to all of us that backing up the EEPROM still
isn't something to be ignored and I'm feeling much more at ease knowing I've
done mine.

I was doing a bit more searching todfay and came across this
page........

http://geophysics.ou.edu/home/pcr1000/backup_eeprom.html

There's some reports on there that show EEPROM results from 14
different PCR1000s and also a calculated average for each location, which
are encouragingly similar to Patrick's average values:-)

There's also the indication I was looking for of what each location
represents and whilst some are just shown as "reserved", most seem to be
reference levels for the S meter and band pass filter tuning points which might
explain why a receiver showing very close to the crash pattern, as yours was,
could still appear fully functional if nothing more critical had been
affected.

My receiver serial number is in the
02300 range so would be concurrent with when you wrote your program.
It's encouraging that it has proved reliable over 10 years or more. If
being developed and you had been looking for feedback I would have suggested
that content and frequency adjustment should not begin without
warnings.

Can
you clarify your meaning of "crashed", what the "smart set" is, the simplest
way possible to "adjust the frequency" and is the above what the pattern
typically becomes?

Meantime,
I'll search for an EEPROM backup done with another program and see if/how it
differs. Hopefulluy any corruption occurred after I made that
backup.
It
is interesting that in gereral usage nothing indicated any strangenesses
until today!

Regards,

Fred.

Subject: Re:
[PCR1000] Pcr 1000bur user guide

I remember there was a pattern for the crashed
PCR1000,
I wonder how your receiver works well if it has the
values so identical to the crashed pattern? it's very
weird...

Of course all my statistical model was based on the
early production units, I really do not know if things changed on
the memory mappings; but it is still weird how close to the crashed
pattern your values are...

you could very well apply the
"smart set" of course you need to adjust the frequency as that
parameter had very high deviation. Then if you do not like it you
can restore your values from your back-up. I did it million times on
my unit and I never crashed it once.

I have a pretty good
record of more than 10 years with no-one telling me that crashed his
box because of my soft ;-)))

Completing a bit the story, yes
the initial mod was a comparing the different PCBs. The only
difference were some surface mounted "resistors" operating as
switches giving a hardware configuration. Next some Icom internal
software leaked and the rest was easy...
;-)

Best,
Pat

Thanks
Patrick,
I sometimes more enjoy getting things to work too
:-)
Never had cause to fix my PCR1000 but followed temptation,
installed and ran your program, backed up and compared the EEPROM
successfully.

However, I was surprised that the EEPROM
Analysis showed Crashed Pattern Matching = 99%, Values Out of

Statistical Margins = 93%, Reference Frecuency Value =
128.

Following
the "Advice: Your EEPROM shows the Crash Pattern, please apply an
Smart Set Average Data" resulted in the EEPROM content being
modified without warning and "Ref. Xtal Freq. Adj."
required.

I
then decided to exit, play safe and restored the EEPROM content to
original.

The
radio appears to operate as before but would you know
if anything might have changed that I should
consider?

Also,
would the program be valid for later serial number PCR1000s as
well as earlier (like mine)?

Fred.

It takes talent to write such a program and
PCR1000BUR looks intriguing.
Especially
the implication of Nigel's observation about setting the
"country code".

Does
this mean that after backing up a cellular blocked US
version PCR1000, if the country code is changed then the
EEPROM contents restored, unrestricted frequency
coverage becomes possible?

Fred.

Subject: Re:
[PCR1000] Pcr 1000bur user guide

Hi
I wrote PCR1000BUR some
time ago;
yes the info on how to use it is
within the program.
I remember the default
parameters where taken from the statistic
gathered from people's backup files.
There's
only one parameter (frequency offset) that
presented a huge dispersion then setting that
from a default set of values will sure lead to
problems.
For fixing that parameter the
program included a module of FFT that help you
to quickly and accurately calibrate the receiver
frequency when tuning a standard frequency from
a couple of satellites,... I'm pulling this out
of my memory, everything is well explained

within the software.

Best,
Patrick

PC1000BUR was/is a program
writtten by Patrick Masotta for backing up and
restoring the EEPROM calibration data in the
PCR1000 to allow a corrupted EEPROM to be
restored without needing to send the radio back
to Icom.

It also allowed some EEPROM parameters to
be edited and recalibrated.

In order to refresh my memory I've just
installed my copy of PCR1000BUR 1v2 and as I
suspected there is a help file/manual built into
the program.

There were other Backup/Restore programs,
one at least of which came with a default EEPROM
data file as a sort of "Get out of jail free
card" for those who didn't have a backup of
their own data, but I don't seem to have copies
of any of these anymore.

There's a copy of PCR1000BUR 1v2 in the
group files section. It's not the copy I
installed so can't vouch for it but I'm sure it
will be ok.
The software won't run if it doesn't find a
PCR1000 to connect to, not even to allow the
manual to be read.

I do remember now using this software
before when I had my first PCR1000 and I've just
used it to make an EEPROM backup of my
current receiver, which is a very quick and
easy process.
I generally use Icom's own control
software, and Icom always insisted, in the past
anyway, that an EEPROM could only become
corrupted through using third party software,
well the would wouldn't they:-), but there's no
harm in having some insurance.

As an extra "bonus" I see from the manual
that there's also an option to specify
the "country code" when reinstalling the data so
a possible instant coverage upgrade for
some:-)

```

My receiver serial number is in the 02300 range so would be concurrent with when you wrote your program. It's encouraging that it has proved reliable over 10 years or more. If being developed and you had been looking for feedback I would have suggested that content and frequency adjustment should not begin without warnings.
Can you clarify your meaning of "crashed", what the "smart set" is, the simplest way possible to "adjust the frequency" and is the above what the pattern typically becomes?
Meantime, I'll search for an EEPROM backup done with another program and see if/how it differs. Hopefulluy any corruption occurred after I made that backup.It is interesting that in gereral usage nothing indicated any strangenesses until today!

Regards,
Fred.

Subject: Re: [PCR1000] Pcr 1000bur user guide

I remember there was a pattern for the crashed PCR1000,
I wonder how your receiver works well if it has the values so identical to the crashed pattern? it's very weird...

Of course all my statistical model was based on the early production units, I really do not know if things changed on the memory mappings; but it is still weird how close to the crashed pattern your values are...

you could very well apply the "smart set" of course you need to adjust the frequency as that parameter had very high deviation. Then if you do not like it you can restore your values from your back-up. I did it million times on my unit and I never crashed it once.

I have a pretty good record of more than 10 years with no-one telling me that crashed his box because of my soft ;-)))

Completing a bit the story, yes the initial mod was a comparing
the
different PCBs. The only difference were some surface mounted "resistors" operating as switches giving a hardware configuration. Next some Icom internal software leaked and the rest was easy... ;-)

Best,
Pat

Thanks Patrick,
I sometimes more enjoy getting things to work too :-)
Never had cause to fix my PCR1000 but followed temptation, installed and ran your program, backed up and compared the EEPROM successfully.

However, I was surprised that the EEPROM Analysis showed Crashed Pattern Matching = 99%, Values Out of Statistical Margins = 93%, Reference Frecuency Value = 128.
Following the "Advice: Your EEPROM shows the Crash Pattern, please apply an Smart Set Average Data" resulted in the EEPROM content being modified without warning and "Ref. Xtal Freq. Adj." required.
I then decided to exit, play safe and restored the EEPROM content to original.
The radio appears to operate as before but would you know if anything might have changed that I should consider?
Also, would the program be valid for later serial number PCR1000s as well as earlier (like mine)?

Sent: Friday, 1 March 2013, 8:46
Subject: Re: [PCR1000] Pcr 1000bur user guide

Hi
I wrote PCR1000BUR some time ago;
yes the info on how to use it is within the program.
I remember the default parameters where taken from the statistic gathered from people's backup files.
There's only one parameter (frequency offset) that presented a huge dispersion then setting that from a default set of values will sure lead to problems.
For fixing that parameter the program included a module of FFT that help you to quickly and accurately calibrate the receiver frequency when tuning a standard frequency from a couple of satellites,... I'm pulling this out of my memory, everything is well explained within the software.

Best,
Patrick

PC1000BUR was/is a program writtten by Patrick Masotta for backing up and
restoring the EEPROM calibration data in the PCR1000 to allow a corrupted EEPROM
to be restored without needing to send the radio back to Icom.

It also allowed some EEPROM parameters to be edited
and recalibrated.

In order to refresh my memory I've just installed my copy of PCR1000BUR 1v2
and as I suspected there is a help file/manual built into the program.

There were other Backup/Restore programs, one at least of which came with a
default EEPROM data file as a sort of "Get out of jail free card" for those who
didn't have a backup of their own data, but I don't seem to have copies of
any of these anymore.

There's a copy of PCR1000BUR 1v2 in the group files section. It's not the
copy I installed so can't vouch for it but I'm sure it will be ok.
The software won't run if it doesn't find a PCR1000 to connect to, not even
to allow the manual to be read.

I do remember now using this software before when I had my first PCR1000
and I've just used it to make an EEPROM backup of my current receiver,
which is a very quick and easy process.
I generally use Icom's own control software, and Icom always insisted, in
the past anyway, that an EEPROM could only become corrupted through using third
party software, well the would wouldn't they:-), but there's no harm in having
some insurance.

As an extra "bonus" I see from the manual that there's also an
option to specify the "country code" when reinstalling the data so a possible
instant coverage upgrade for some:-)

Hi Fred

That certainly looks a lot closer to Patrick's average data, just as well
you took the earlier backup, I wonder what caused it to change so much.

It's certainly a warning to all of us that backing up the EEPROM still
isn't something to be ignored and I'm feeling much more at ease knowing I've
done mine.

I was doing a bit more searching todfay and came across this
page........

http://geophysics.ou.edu/home/pcr1000/backup_eeprom.html

There's some reports on there that show EEPROM results from 14
different PCR1000s and also a calculated average for each location, which
are encouragingly similar to Patrick's average values:-)

There's also the indication I was looking for of what each location
represents and whilst some are just shown as "reserved", most seem to be
reference levels for the S meter and band pass filter tuning points which might
explain why a receiver showing very close to the crash pattern, as yours was,
could still appear fully functional if nothing more critical had been
affected.

Hi
I wrote PCR1000BUR some
time ago;

yes the info on how to use it is
within the program.
I remember the default
parameters where taken from the statistic
gathered from people's backup files.
There's
only one parameter (frequency offset) that
presented a huge dispersion then setting that
from a default set of values will sure lead to
problems.
For fixing that parameter the
program included a module of FFT that help you
to quickly and accurately calibrate the receiver
frequency when tuning a standard frequency from
a couple of satellites,... I'm pulling this out
of my memory, everything is well explained
within the software.

Best,
Patrick

PC1000BUR was/is a program
writtten by Patrick Masotta for backing up and
restoring the EEPROM calibration data in the
PCR1000 to allow a corrupted EEPROM to be
restored without needing to send the radio back
to Icom.

It also allowed some EEPROM parameters to
be edited and recalibrated.

In order to refresh my memory I've just
installed my copy of PCR1000BUR 1v2 and as I
suspected there is a help file/manual built into
the program.

There were other Backup/Restore programs,
one at least of which came with a default EEPROM
data file as a sort of "Get out of jail free
card" for those who didn't have a backup of
their own data, but I don't seem to have copies
of any of these anymore.

There's a copy of PCR1000BUR 1v2 in the
group files section. It's not the copy I
installed so can't vouch for it but I'm sure it
will be ok.
The software won't run if it doesn't find a
PCR1000 to connect to, not even to allow the
manual to be read.

I do remember now using this software
before when I had my first PCR1000 and I've just
used it to make an EEPROM backup of my
current receiver, which is a very quick and
easy process.
I generally use Icom's own control
software, and Icom always insisted, in the past
anyway, that an EEPROM could only become
corrupted through using third party software,
well the would wouldn't they:-), but there's no
harm in having some insurance.

As an extra "bonus" I see from the manual
that there's also an option to specify
the "country code" when reinstalling the data so
a possible instant coverage upgrade for
some:-)

So far, so very good by the sound of things:-)

I was certainly surprised to see just how close your values were to the "crash" values, I'm assuming they were called that because that's what folks ended up with after a very definite crash that caused far more serious problems, so it seems like you got away with just a scrape to the paintwork rather than mangled bodywork:-)

There never seemed to be any further response from whoever asked about the PCR1000BUR manual, but many thanks to whoever it was for bringing this back to my attention.

regards

Nigel

Hi Nigel,

Too right about backing up.
As a long term believer I back up anything needing backing up.
Then I backup up the backed-up backup! :-)

The EEPROM content was saved as soon as I became aware of BACKPCR around June 1996 and several further backups since may indicate when the data became corrupted. I go through phases of interest in listening and it may well have resulted from experimenting recently with PCR1000 programs that mainly didn't run well on Puppy Linux and Wine on a flash drive.

Following your link and interpretation credibly explains why my PCR1000 showed no dramatic change in performance. Bandscope and S meter sensitivity were reduced but not greatly, I didn't observe odd AFC problems and operation was not obviously impaired. I suspect that if my "crashed" EPROM content were loaded to another PCR1000 the result could be similar.

What I now observe is that Bandscope amplitude is increased by perhaps a third, indicated signal strength is a couple of S points higher on favourite local broadcast stations and displayed frequency accuracy is within a few hertz of zerobeat on USB/LSB.

So far, so good :-)

Fred.

Hi Fred

That certainly looks a lot closer to Patrick's average data, just as well you took the earlier backup, I wonder what caused it to change so much.

It's certainly a warning to all of us that backing up the EEPROM still isn't something to be ignored and I'm feeling much more at ease knowing I've done mine.

I was doing a bit more searching todfay and came across this page........

_http://geophysics.ou.edu/home/pcr1000/backup_eeprom.html_
(http://geophysics.ou.edu/home/pcr1000/backup_eeprom.html)

There's some reports on there that show EEPROM results from 14 different PCR1000s and also a calculated average for each location, which are encouragingly similar to Patrick's average values:-)

There's also the indication I was looking for of what each location represents and whilst some are just shown as "reserved", most seem to be reference levels for the S meter and band pass filter tuning points which might explain why a receiver showing very close to the crash pattern, as yours was, could still appear fully functional if nothing more critical had been affected.

Subject: Re: [PCR1000] Pcr 1000bur user guide

Hi
I wrote PCR1000BUR some time ago;
yes the info on how to use it is within the program.
I remember the default parameters where taken from the statistic gathered from people's backup files.
There's only one parameter (frequency offset) that presented a huge dispersion then setting that from a default set of values will sure lead to problems.
For fixing that parameter the program included a module of FFT that help you to quickly and accurately calibrate the receiver frequency when tuning a standard frequency from a couple of satellites,... I'm pulling this out of my memory, everything is well explained within the software.

Best,
Patrick

PC1000BUR was/is a program writtten by Patrick Masotta for backing up and restoring the EEPROM calibration data in the PCR1000 to allow a corrupted EEPROM to be restored without needing to send the radio back to Icom.

It also allowed some EEPROM parameters to be edited and recalibrated.

In order to refresh my memory I've just installed my copy of PCR1000BUR 1v2 and as I suspected there is a help file/manual built into the program.

There were other Backup/Restore programs, one at least of which came with a default EEPROM data file as a sort of "Get out of jail free card" for those who didn't have a backup of their own data, but I don't seem to have copies of any of these anymore.

There's a copy of PCR1000BUR 1v2 in the group files section. It's not the copy I installed so can't vouch for it but I'm sure it will be ok.
The software won't run if it doesn't find a PCR1000 to connect to, not even to allow the manual to be read.

I do remember now using this software before when I had my first PCR1000 and I've just used it to make an EEPROM backup of my current receiver, which is a very quick and easy process.
I generally use Icom's own control software, and Icom always insisted, in the past anyway, that an EEPROM could only become corrupted through using third party software, well the would wouldn't they:-), but there's no harm in having some insurance.

As an extra "bonus" I see from the manual that there's also an option to specify the "country code" when reinstalling the data so a possible instant coverage upgrade for some:-)

Hi Patrick

I'd say it was pretty damn good:-)

Having the average data set was, and is, one heck of a bonus for anyone with a corrupt EEPROM who hasn't backed it up beforehand, but given that the original data from any PCR1000 is the specific alignment data for that particular radio taking a backup to start with is always going to be the best option.

With my first receiver I was very careful to back up the EEPROM once the option became available but must admit to becoming complacent with this one, I've had it for nearly a year and didn't even think about backing it up before the recent question about the manual, but Fred's experience has certainly shown the need is as strong as ever, especially if trying out different software options.

In my recent searches I came across a 2005 post to the group from Spain offering corrupt EEPROM repair plus "tuner alignment" for 50 Euro plus postage. They claimed over 30 sets had already been repaired. It sounds like somebody might have been putting your software to very profitable use:-)

Subject: Re: [PCR1000] Pcr 1000bur user guide

Hi
I wrote PCR1000BUR some time ago;
yes the info on how to use it is within the program.
I remember the default parameters where taken from the statistic gathered
from people's backup files.
There's only one parameter (frequency offset) that presented a huge
dispersion then setting that from a default set of values will sure lead to
problems.
For fixing that parameter the program included a module of FFT that help
you to quickly and accurately calibrate the receiver frequency when tuning
a standard frequency from a couple of satellites,... I'm pulling this out
of my memory, everything is well explained within the software.

Best,
Patrick

PC1000BUR was/is a program writtten by Patrick Masotta for backing up and
restoring the EEPROM calibration data in the PCR1000 to allow a corrupted
EEPROM to be restored without needing to send the radio back to Icom.

It also allowed some EEPROM parameters to be edited and recalibrated.

In order to refresh my memory I've just installed my copy of PCR1000BUR
1v2 and as I suspected there is a help file/manual built into the program.

There were other Backup/Restore programs, one at least of which came with a default EEPROM data file as a sort of "Get out of jail free card" for those who didn't have a backup of their own data, but I don't seem to have copies of any of these anymore.

There's a copy of PCR1000BUR 1v2 in the group files section. It's not the copy I installed so can't vouch for it but I'm sure it will be ok.
The software won't run if it doesn't find a PCR1000 to connect to, not even to allow the manual to be read.

I do remember now using this software before when I had my first PCR1000 and I've just used it to make an EEPROM backup of my current receiver, which is a very quick and easy process.
I generally use Icom's own control software, and Icom always insisted, in the past anyway, that an EEPROM could only become corrupted through using third party software, well the would wouldn't they:-), but there's no harm in having some insurance.

As an extra "bonus" I see from the manual that there's also an option to specify the "country code" when reinstalling the data so a possible instant coverage upgrade for some:-)

Hi Fred

That certainly looks a lot closer to Patrick's average data, just as well
you took the earlier backup, I wonder what caused it to change so much.

It's certainly a warning to all of us that backing up the EEPROM still
isn't something to be ignored and I'm feeling much more at ease knowing I've
done mine.

I was doing a bit more searching todfay and came across this page........

_http://geophysics.ou.edu/home/pcr1000/backup_eeprom.html_
(http://geophysics.ou.edu/home/pcr1000/backup_eeprom.html)

There's some reports on there that show EEPROM results from 14 different
PCR1000s and also a calculated average for each location, which are
encouragingly similar to Patrick's average values:-)

There's also the indication I was looking for of what each location
represents and whilst some are just shown as "reserved", most seem to be
reference levels for the S meter and band pass filter tuning points which might
explain why a receiver showing very close to the crash pattern, as yours was,
could still appear fully functional if nothing more critical had been
affected.

Hi Patrick,

Yes - it does seems odd but general functionality and reception appears to be maintained, the receiver finds stored frequencies yet the EEPROM contents are ......
File: PCR1000.DAT Date: 01/03/2013
Back Up Data.

0000 : 0 0 82 88 128 0 0 0
0008 : 0 48 80 112 144 176 208 240
0016 : 0 48 80 112 144 176 208 240
0024 : 0 48 80 112 144 176 208 240
0032 : 115 146 115 146 166 36 0 0
0040 : 0 0 96 160 144 144 144 144
0048 : 144 144 144 144 144 144 144 144

0056 : 144 144 144 144 144 144 144 144
0064 : 144 144 144 144 144 144 144 144
0072 : 144 144 144 144 144 144 144 144
0080 : 144 144 144 144 144 0 0 0
0088 : 128 128 128 128 128 128 128 128
0096 : 128 128 128 128 128 128 128 128
0104 : 128 128 128 128 128 128 128 128
0112 : 128 128 128 128 128 128 128 128
0120 : 128 128 128 128 128 0 2 2

My receiver serial number is in the 02300 range so would be concurrent
with when you wrote your program. It's encouraging that it has proved
reliable over 10 years or more. If being developed and you had been looking for
feedback I would have suggested that content and frequency adjustment
should not begin without warnings.

Can you clarify your meaning of "crashed", what the "smart set" is, the
simplest way possible to "adjust the frequency" and is the above what the
pattern typically becomes?

Meantime, I'll search for an EEPROM backup done with another program and
see if/how it differs. Hopefulluy any corruption occurred after I made
that backup.
It is interesting that in gereral usage nothing indicated any
strangenesses until today!

Regards,

Fred.

Subject: Re: [PCR1000] Pcr 1000bur user guide

I remember there was a pattern for the crashed PCR1000,
I wonder how your receiver works well if it has the values so identical to
the crashed pattern? it's very weird...

Of course all my statistical model was based on the early production
units, I really do not know if things changed on the memory mappings; but it is
still weird how close to the crashed pattern your values are...

you could very well apply the "smart set" of course you need to adjust the
frequency as that parameter had very high deviation. Then if you do not
like it you can restore your values from your back-up. I did it million
times on my unit and I never crashed it once.

I have a pretty good record of more than 10 years with no-one telling me
that crashed his box because of my soft ;-)))

Completing a bit the story, yes the initial mod was a comparing the
different PCBs. The only difference were some surface mounted "resistors" operati
ng as switches giving a hardware configuration. Next some Icom internal
software leaked and the rest was easy... ;-)

Best,
Pat

Thanks Patrick,
I sometimes more enjoy getting things to work too :-)
Never had cause to fix my PCR1000 but followed temptation, installed and
ran your program, backed up and compared the EEPROM successfully.

However, I was surprised that the EEPROM Analysis showed Crashed Pattern
Matching = 99%, Values Out of Statistical Margins = 93%, Reference
Frecuency Value = 128.
Following the "Advice: Your EEPROM shows the Crash Pattern, please apply
an Smart Set Average Data" resulted in the EEPROM content being modified
without warning and "Ref. Xtal Freq. Adj." required.

I then decided to exit, play safe and restored the EEPROM content to
original.

The radio appears to operate as before but would you know if anything
might have changed that I should consider?

Also, would the program be valid for later serial number PCR1000s as well
as earlier (like mine)?

Regards,

Fred.

It takes talent to write such a program and PCR1000BUR looks intriguing.
Especially the implication of Nigel's observation about setting the
"country code".

Does this mean that after backing up a cellular blocked US version
PCR1000, if the country code is changed then the EEPROM contents restored,
unrestricted frequency coverage becomes possible?

Regards,

Fred.

To paraphrase from a Bob Dylan song; hoots of Spanish blether?
Yes suspicious considering the required test equipment, experience and time involved. Applying Icom's (leaked?) alignment program and procedure would be an unusual bargain if 50 Euros (even in 2005). I remember PCR1000s took a huge leap in price (doubled?) toward the end of manufacture and it's now become a classic used bargain. The instant I acquire another, first task....backup!!

And thanks to Alan's original post, I have / we have experienced the ongoing worth of Patrick's efforts.
For which much thanks!

:-)

Hi Patrick

I'd say it was pretty damn good:-)

Having the average data set was, and is, one heck of a bonus for
anyone with a corrupt EEPROM who hasn't backed it up beforehand, but
given that the original data from any PCR1000 is the specific alignment
data for that particular radio taking a backup to start with is
always going to be the best option.

With my first receiver I was very careful to back up the EEPROM once the
option became available but must admit to becoming complacent with this one,
I've had it for nearly a year and didn't even think about backing it up before
the recent question about the manual, but Fred's experience has certainly shown
the need is as strong as ever, especially if trying out different software
options.

In my recent searches I came across a 2005 post to the
group from Spain offering corrupt EEPROM repair plus "tuner alignment"
for 50 Euro plus postage. They claimed over 30 sets had already been repaired.
It sounds like somebody might have been putting your software to very
profitable use:-)

Regards

Nigel

Hi
Nigel,

Too right about backing up.
As a long term believer I
back up anything needing backing up.
Then I backup up the backed-up
backup! :-)

The EEPROM content was saved as soon as I became
aware of BACKPCR around June 1996 and several further backups since
may indicate when the data became corrupted. I go through phases
of interest in listening and it may well have resulted from
experimenting recently with PCR1000 programs that mainly didn't run
well on Puppy Linux and Wine on a flash drive.

Following your
link and interpretation credibly explains why my PCR1000 showed no
dramatic change in performance.   Bandscope and S meter
sensitivity were reduced but not greatly, I didn't observe odd AFC
problems and operation was not obviously impaired. I suspect
that if my "crashed" EPROM content were loaded to another PCR1000 the
result could be similar.

What I now observe is that Bandscope
amplitude is increased by perhaps a third, indicated signal strength
is a couple of S points higher on favourite local broadcast stations
and displayed frequency accuracy is within a few hertz of zerobeat on
USB/LSB.

So far, so good :-)

Fred.

Subject: Re: [PCR1000] Pcr
1000bur user guide

Hi Fred

That certainly looks a lot closer to Patrick's average data,
just as well you took the earlier backup, I wonder what caused it to
change so much.

It's certainly a warning to all of us that backing up the
EEPROM still isn't something to be ignored and I'm feeling much more
at ease knowing I've done mine.

I was doing a bit more searching todfay and came across
this page.....

http://geophysics.ou.edu/home/pcr1000/backup_eeprom.html

There's some reports on there that show EEPROM results
from 14 different PCR1000s and also a calculated average for
each location, which are encouragingly similar to Patrick's
average values:-)

There's also the indication I was looking for of what each
location represents and whilst some are just shown as "reserved",
most seem to be reference levels for the S meter and band pass
filter tuning points which might explain why a receiver showing very
close to the crash pattern, as yours was, could still appear fully
functional if nothing more critical had been affected.

Regards

Nigel

My receiver serial number is in the 02300 range
so would be concurrent with when you wrote your program.
It's encouraging that it has proved reliable over 10 years or
more. If being developed and you had been looking for
feedback I would have suggested that content and frequency
adjustment should not begin without warnings.

Can
you clarify your meaning of "crashed", what the "smart set" is,
the simplest way possible to "adjust the frequency" and is the
above what the pattern typically becomes?

Meantime,
I'll search for an EEPROM backup done with another program and
see if/how it differs. Hopefulluy any corruption occurred
after I made that backup.
It
is interesting that in gereral usage nothing indicated any
strangenesses until today!

Regards,

Fred.

Subject: Re: [PCR1000]
Pcr 1000bur user guide

I remember there was a pattern for the
crashed PCR1000,
I wonder how your receiver works
well if it has the values so identical to the crashed
pattern? it's very weird...

Of course all my
statistical model was based on the early production
units, I really do not know if things changed on the
memory mappings; but it is still weird how close to the
crashed pattern your values are...

you could very
well apply the "smart set" of course you need to adjust
the frequency as that parameter had very high deviation.
Then if you do not like it you can restore your values
from your back-up. I did it million times on my unit and
I never crashed it once.

I have a pretty good
record of more than 10 years with no-one telling me that
crashed his box because of my soft
;-)))

Completing a bit the story, yes the initial
mod was a comparing the different PCBs. The only
difference were some surface mounted "resistors"
operating as switches giving a hardware configuration.
Next some Icom internal software leaked and the rest was
easy... ;-)

Best,
Pat

Thanks
Patrick,
I sometimes more enjoy getting things to
work too :-)
Never had cause to fix my PCR1000 but
followed temptation, installed and ran your program,
backed up and compared the EEPROM
successfully.

However, I was surprised that the
EEPROM Analysis showed Crashed Pattern Matching = 99%,
Values Out of Statistical Margins = 93%,
Reference Frecuency Value = 128.

Following
the "Advice: Your EEPROM shows the Crash Pattern,
please apply an Smart Set Average Data" resulted in
the EEPROM content being modified without warning and
"Ref. Xtal Freq. Adj." required.

I
then decided to exit, play safe and restored the
EEPROM content to original.

The
radio appears to operate as before but would you know
if anything might have changed that
I should consider?

Also,
would the program be valid for later serial number
PCR1000s as well as earlier (like mine)?

Yes it was like you say on those
days,
after some time Icom released a
"fixed" version covering the hole and the mod
wasn't possible anymore...
I have to say I
got more fun programing that soft than listening
to the receiver
;-)

Best,
Pat

It takes talent to write such a
program and PCR1000BUR looks
intriguing.
Especially
the implication of Nigel's observation about
setting the "country code".

Does
this mean that after backing up a cellular
blocked US version PCR1000, if the country code
is changed then the EEPROM contents restored,
unrestricted frequency coverage becomes
possible?

Regards,

Fred.

Re: [PCR1000] Pcr 1000bur user
guide

Hi
I wrote PCR1000BUR some
time ago;
yes the info on how to use it is
within the program.
I remember the default
parameters where taken from the statistic
gathered from people's backup files.
There's
only one parameter (frequency offset) that
presented a huge dispersion then setting that
from a default set of values will sure lead to
problems.
For fixing that parameter the
program included a module of FFT that help you
to quickly and accurately calibrate the receiver
frequency when tuning a standard frequency from
a couple of satellites,... I'm pulling this out
of my memory, everything is well explained
within the software.

Best,
Patrick

PC1000BUR was/is a program
writtten by Patrick Masotta for backing up and
restoring the EEPROM calibration data in the
PCR1000 to allow a corrupted EEPROM to be
restored without needing to send the radio back
to Icom.

It also allowed some EEPROM parameters to
be edited and recalibrated.

In order to refresh my memory I've just
installed my copy of PCR1000BUR 1v2 and as I
suspected there is a help file/manual built into
the program.

There were other Backup/Restore programs,
one at least of which came with a default EEPROM
data file as a sort of "Get out of jail free
card" for those who didn't have a backup of
their own data, but I don't seem to have copies
of any of these anymore.

There's a copy of PCR1000BUR 1v2 in the
group files section. It's not the copy I
installed so can't vouch for it but I'm sure it
will be ok.
The software won't run if it doesn't find a
PCR1000 to connect to, not even to allow the
manual to be read.

I do remember now using this software
before when I had my first PCR1000 and I've just
used it to make an EEPROM backup of my
current receiver, which is a very quick and
easy process.
I generally use Icom's own control
software, and Icom always insisted, in the past
anyway, that an EEPROM could only become
corrupted through using third party software,
well the would wouldn't they:-), but there's no
harm in having some insurance.

As an extra "bonus" I see from the manual
that there's also an option to specify
the "country code" when reinstalling the data so
a possible instant coverage upgrade for
some:-)

That's a great paraphrase:-)

All the more so because "having a good old blether" is one of my wife's favourite expressions and/or pastimes, although I suspect she'd prefer the Nanci Griffith's version of the song:-)

I'm pretty sure there wouldn't have been any expensive test gear or a copy of EX2099 within a million miles, what they actually offered was....

"We include original & repaired eeprom on floppy/cdrom, and tuner alignment of the receiver is included in the service"

Which to me sounds very much like....

"We'll use Patrick's software to read your EEPROM data, replace it with his set of average data, and send you a copy of both, plus we'll also use his FFT option to adjust your reference crystal frequency, and that'll be 50 euro and thank you kindly sir" :-)

I could never understand why the price took such a leap, if the set had already been discontinued and that was the resulting speculative price from Ebay sellers etc it might have made a bit more sense, something like the silly prices again that the unlocked sets were fetching, but to double the retail price overnight was certainly an "interesting" marketing technique.

Yes suspicious considering the required test equipment, experience and time involved. Applying Icom's (leaked?) alignment program and procedure would be an unusual bargain if 50 Euros (even in 2005). I remember PCR1000s took a huge leap in price (doubled?) toward the end of manufacture and it's now become a classic used bargain. The instant I acquire another, first task....backup!!

And thanks to Alan's original post, I have / we have experienced the ongoing worth of Patrick's efforts.
For which much thanks!

Hi Patrick

I'd say it was pretty damn good:-)

Having the average data set was, and is, one heck of a bonus for anyone with a corrupt EEPROM who hasn't backed it up beforehand, but given that the original data from any PCR1000 is the specific alignment data for that particular radio taking a backup to start with is always going to be the best option.

With my first receiver I was very careful to back up the EEPROM once the option became available but must admit to becoming complacent with this one, I've had it for nearly a year and didn't even think about backing it up before the recent question about the manual, but Fred's experience has certainly shown the need is as strong as ever, especially if trying out different software options.

In my recent searches I came across a 2005 post to the group from Spain offering corrupt EEPROM repair plus "tuner alignment" for 50 Euro plus postage. They claimed over 30 sets had already been repaired. It sounds like somebody might have been putting your software to very profitable use:-)

Hi Nigel,

Too right about backing up.
As a long term believer I back up anything needing backing up.
Then I backup up the backed-up backup! :-)

The EEPROM content was saved as soon as I became aware of BACKPCR around June 1996 and several further backups since may indicate when the data became corrupted. I go through phases of interest in listening and it may well have resulted from experimenting recently with PCR1000 programs that mainly didn't run well on Puppy Linux and Wine on a flash drive.

Following your link and interpretation credibly explains why my PCR1000 showed no dramatic change in performance. Bandscope and S meter sensitivity were reduced but not greatly, I didn't observe odd AFC problems and operation was not obviously impaired. I suspect that if my "crashed" EPROM content were loaded to another PCR1000 the result could be similar.

What I now observe is that Bandscope amplitude is increased by perhaps a third, indicated signal strength is a couple of S points higher on favourite local broadcast stations and displayed frequency accuracy is within a few hertz of zerobeat on USB/LSB.

So far, so good :-)

Fred.

Hi Fred

That certainly looks a lot closer to Patrick's average data, just as well you took the earlier backup, I wonder what caused it to change so much.

It's certainly a warning to all of us that backing up the EEPROM still isn't something to be ignored and I'm feeling much more at ease knowing I've done mine.

I was doing a bit more searching todfay and came across this page.....

_http://geophysics.ou.edu/home/pcr1000/backup_eeprom.html_
(http://geophysics.ou.edu/home/pcr1000/backup_eeprom.html)

There's some reports on there that show EEPROM results from 14 different PCR1000s and also a calculated average for each location, which are encouragingly similar to Patrick's average values:-)

There's also the indication I was looking for of what each location represents and whilst some are just shown as "reserved", most seem to be reference levels for the S meter and band pass filter tuning points which might explain why a receiver showing very close to the crash pattern, as yours was, could still appear fully functional if nothing more critical had been affected.

0112 : 128 128 128 128 128 128 128 128
0120 : 128 128 128 128 128 0 2 2

My receiver serial number is in the 02300 range so would be concurrent
with when you wrote your program. It's encouraging that it has proved
reliable over 10 years or more. If being developed and you had been looking for
feedback I would have suggested that content and frequency adjustment
should not begin without warnings.

Can you clarify your meaning of "crashed", what the "smart set" is, the
simplest way possible to "adjust the frequency" and is the above what the
pattern typically becomes?

Meantime, I'll search for an EEPROM backup done with another program and
see if/how it differs. Hopefulluy any corruption occurred after I made
that backup.
It is interesting that in gereral usage nothing indicated any
strangenesses until today!

Regards,

Fred.

Subject: Re: [PCR1000] Pcr 1000bur user guide

I remember there was a pattern for the crashed PCR1000,
I wonder how your receiver works well if it has the values so identical to
the crashed pattern? it's very weird...

Of course all my statistical model was based on the early production
units, I really do not know if things changed on the memory mappings; but it is
still weird how close to the crashed pattern your values are...

you could very well apply the "smart set" of course you need to adjust the
frequency as that parameter had very high deviation. Then if you do not

like it you can restore your values from your back-up. I did it million times on my unit and I never crashed it once.

I have a pretty good record of more than 10 years with no-one telling me that crashed his box because of my soft ;-)))

Completing a bit the story, yes the initial mod was a comparing the different PCBs. The only difference were some surface mounted "resistors" operating as switches giving a hardware configuration. Next some Icom internal software leaked and the rest was easy... ;-)

Best,
Pat

Thanks Patrick,
I sometimes more enjoy getting things to work too :-)
Never had cause to fix my PCR1000 but followed temptation, installed and ran your program, backed up and compared the EEPROM successfully.

However, I was surprised that the EEPROM Analysis showed Crashed Pattern Matching = 99%, Values Out of Statistical Margins = 93%, Reference Frecuency Value = 128.
Following the "Advice: Your EEPROM shows the Crash Pattern, please apply an Smart Set Average Data" resulted in the EEPROM content being modified without warning and "Ref. Xtal Freq. Adj." required.

I then decided to exit, play safe and restored the EEPROM content to original.

The radio appears to operate as before but would you know if anything might have changed that I should consider?

Also, would the program be valid for later serial number PCR1000s as well as earlier (like mine)?

Yes, the BBC Nanci Griffith version of the song is a favourite I viewed again recently and somehow paraphrasing the title seemed apt. But we have to bear in mind that the suspicion is pure conjecture without access to fact and those whose receivers were resurrected no doubt thought 50 euros very reasonable for the result.

That my EEPROM content was so close to "crashed" yet remained working begs the question of what locations and values would would have totally disabled the receiver? And could that happening inhibit restoring content from a backup? My feeling is that the EEPROM could be scrambled yet the receiver remain viable to some degree.

But I daren't test that idea!

:-)

6051. PCR Remote (Client) Version 0.99.069 Now Available

Yahoo group: PCR1000
Date: 2013-03-04 02:41:08 UTC
From: Jay
Topic: 6051 Message: 6051

PCR Remote (Client) Version 0.99.069 Now Available for Downloading from the HomePage:
http://www.fiftyonefiftysystems.com/PcrRemote/PcrRemoteDwnld.html

This update has Two Additions and Three Changes...

--------------- Client Updates ONLY --------------
Mar 03,2013 - -----: Server Popup->LogIn Menu Only Enabled If You Click On A Server.
Mar 03,2013 - -----: Server Popup->Edit Menu Only Enabled If You Click On A Server.
Mar 03,2013 - -----: Server Popup->Delete Menu Now Enabled If You Have More Than 1 Server In Your List.
Mar 03,2013 - Added: You Can Now Assign a Server as Default in Server List.
Mar 03,2013 - Added: Server Menu -> Show Server List When Connection Lost.

Version 0.99.069 Released 03/03/2013

Regards,
Jay

6052. Re: [PCR1000] Pcr 1000bur user guide

Yahoo group: PCR1000

From: Patrick Masotta
Topic: 6011 Message: 6052

It wasn't like that, in general when your receiver got screwed you were not able to use it.

Now I can think of Icom finding what I called later the "crashed pattern" probably also as an average set of parameter but different batch of components might've transformed that set on the real "crashed pattern"

Then sure there are people like you with a crashed pattern and a working receiver
while some others when the receiver got a corrupted EEPROM a mandatory recalibration was the only option... just an idea...

Pat

Yes, the BBC Nanci Griffith version of the song is a favourite I viewed again recently and somehow paraphrasing the title seemed apt. But we have to bear in mind that the suspicion is pure conjecture without access to fact and those whose receivers were resurrected no doubt thought 50 euros very reasonable for the result.

That my EEPROM content was so close to "crashed" yet remained working begs the question of what locations and values would would have totally disabled the receiver? And could that happening inhibit restoring content from a backup? My feeling is that the EEPROM could be scrambled yet the receiver remain viable to some degree.

But I daren't test that idea!

:-)

Fred.

Subject: Re: [PCR1000] Pcr 1000bur user guide

That's a great paraphrase:-)

All the more so because "having a good old blether" is one of my
wife's favourite expressions and/or pastimes, although I suspect she'd prefer
the Nanci Griffith's version of the song:-)

I'm pretty sure there wouldn't have been any expensive test gear or a
copy of EX2099 within a million miles, what they actually offered

was....

"We include original & repaired eeprom on floppy/cdrom, and tuner
alignment of the receiver is included in the service"

Which to me sounds very much like....

"We'll use Patrick's software to read your EEPROM data, replace it with his
set of average data, and send you a copy of both, plus we'll also use his FFT
option to adjust your reference crystal frequency, and that'll be 50
euro and thank you kindly sir" :-)

I could never understand why the price took such a leap, if the set had
already been discontinued and that was the resulting speculative price from Ebay
sellers etc it might have made a bit more sense, something like the silly
prices again that the unlocked sets were fetching, but to double the retail
price overnight was certainly an "interesting" marketing technique.

Regards

Nigel

glenndriech@yahoo.co.uk writes:

To
paraphrase from a Bob Dylan song; hoots of Spanish blether?
Yes suspicious
considering the required test equipment, experience and time involved.
Applying Icom's (leaked?) alignment program and procedure would be an unusual
bargain if 50 Euros (even in 2005). I remember PCR1000s took a huge leap
in price (doubled?) toward the end of manufacture and it's now become a
classic used bargain. The instant I acquire another, first
task....backup!!

And thanks to Alan's original post, I have / we have
experienced the ongoing worth of Patrick's efforts.
For which much
thanks!

:-)

[PCR1000] Pcr 1000bur user guide

Hi Patrick

I'd say it was pretty damn good:-)

Having the average data set was, and is, one heck of a bonus for anyone with a corrupt EEPROM who hasn't backed it up beforehand, but given that the original data from any PCR1000 is the specific alignment data for that particular radio taking a backup to start with is always going to be the best option.

With my first receiver I was very careful to back up the EEPROM once the option became available but must admit to becoming complacent with this one, I've had it for nearly a year and didn't even think about backing it up before the recent question about the manual, but Fred's experience has certainly shown the need is as strong as ever, especially if trying out different software options.

In my recent searches I came across a 2005 post to the group from Spain offering corrupt EEPROM repair plus "tuner alignment" for 50 Euro plus postage. They claimed over 30 sets had already been repaired. It sounds like somebody might have been putting your software to very profitable use:-)

Hi
Nigel,

Too right about backing up.
As a long term

believer I back up anything needing backing up.
Then I backup
up the backed-up backup! :-)

The EEPROM content was saved
as soon as I became aware of BACKPCR around June 1996 and several
further backups since may indicate when the data became
corrupted. I go through phases of interest in listening and
it may well have resulted from experimenting recently with PCR1000
programs that mainly didn't run well on Puppy Linux and Wine on a
flash drive.

Following your link and interpretation
credibly explains why my PCR1000 showed no dramatic change in
performance. Bandscope and S meter sensitivity were
reduced but not greatly, I didn't observe odd AFC problems and
operation was not obviously impaired. I suspect that if my
"crashed" EPROM content were loaded to another PCR1000 the result
could be similar.

What I now observe is that Bandscope
amplitude is increased by perhaps a third, indicated signal
strength is a couple of S points higher on favourite local
broadcast stations and displayed frequency accuracy is within a
few hertz of zerobeat on USB/LSB.

So far, so good
:-)

Fred.

Hi Fred

That certainly looks a lot closer to Patrick's average
data, just as well you took the earlier backup, I wonder what
caused it to change so much.

It's certainly a warning to all of us that backing up the
EEPROM still isn't something to be ignored and I'm feeling much
more at ease knowing I've done mine.

I was doing a bit more searching todfay and came
across this page.....

http://geophysics.ou.edu/home/pcr1000/backup_eeprom.html

There's some reports on there that show EEPROM results
from 14 different PCR1000s and also a calculated average
for each location, which are encouragingly similar to
Patrick's average values:-)

There's also the indication I was looking for of what each
location represents and whilst some are just shown as
"reserved", most seem to be reference levels for the S meter and
band pass filter tuning points which might explain why a
receiver showing very close to the crash pattern, as yours was,
could still appear fully functional if nothing
more critical had been affected.

Regards

Nigel

My receiver serial number is in the 02300
range so would be concurrent with when you wrote your
program. It's encouraging that it has proved reliable
over 10 years or more. If being developed and you had
been looking for feedback I would have suggested that
content and frequency adjustment should not begin without
warnings.

Can
you clarify your meaning of "crashed", what the "smart set"
is, the simplest way possible to "adjust the frequency" and
is the above what the pattern typically becomes?

Meantime,
I'll search for an EEPROM backup done with another program
and see if/how it differs. Hopefulluy any corruption
occurred after I made that backup.
It
is interesting that in gereral usage nothing indicated any
strangenesses until today!

Regards,

Fred.

Subject: Re:
[PCR1000] Pcr 1000bur user guide

I remember there was a pattern for
the crashed PCR1000,
I wonder how your receiver
works well if it has the values so identical to the
crashed pattern? it's very weird...

Of course
all my statistical model was based on the early
production units, I really do not know if things
changed on the memory mappings; but it is still
weird how close to the crashed pattern your values
are...

you could very well apply the "smart
set" of course you need to adjust the frequency as
that parameter had very high deviation. Then if you
do not like it you can restore your values from your
back-up. I did it million times on my unit and I
never crashed it once.

I have a pretty good
record of more than 10 years with no-one telling me
that crashed his box because of my soft
;-)))

Completing a bit the story, yes the
initial mod was a comparing the different PCBs. The
only difference were some surface mounted
"resistors" operating as switches giving a hardware
configuration. Next some Icom internal software
leaked and the rest was easy...
;-)

Best,
Pat

Thanks
Patrick,
I sometimes more enjoy getting things
to work too :-)
Never had cause to fix my
PCR1000 but followed temptation, installed and ran
your program, backed up and compared the EEPROM
successfully.

However, I was surprised that
the EEPROM Analysis showed Crashed Pattern
Matching = 99%, Values Out of Statistical Margins
= 93%, Reference Frecuency Value =
128.

Following
the "Advice: Your EEPROM shows the Crash Pattern,
please apply an Smart Set Average Data" resulted
in the EEPROM content being modified without
warning and "Ref. Xtal Freq. Adj."
required.

I
then decided to exit, play safe and restored the
EEPROM content to original.

The
radio appears to operate as before but would you
know if anything might have
changed that I should consider?

Also,
would the program be valid for later serial number
PCR1000s as well as earlier (like mine)?

It takes talent to write such a
program and PCR1000BUR looks
intriguing.
Especially
the implication of Nigel's observation about
setting the "country code".

Does
this mean that after backing up a cellular
blocked US version PCR1000, if the country code

is changed then the EEPROM contents restored,
unrestricted frequency coverage becomes
possible?

Re: [PCR1000] Pcr 1000bur user
guide

Hi
I wrote PCR1000BUR some
time ago;
yes the info on how to use it is
within the program.
I remember the default
parameters where taken from the statistic
gathered from people's backup files.
There's
only one parameter (frequency offset) that
presented a huge dispersion then setting that
from a default set of values will sure lead to
problems.
For fixing that parameter the
program included a module of FFT that help you
to quickly and accurately calibrate the receiver
frequency when tuning a standard frequency from
a couple of satellites,... I'm pulling this out
of my memory, everything is well explained
within the software.

Best,
Patrick

PC1000BUR was/is a program
writtten by Patrick Masotta for backing up and
restoring the EEPROM calibration data in the
PCR1000 to allow a corrupted EEPROM to be
restored without needing to send the radio back
to Icom.

It also allowed some EEPROM parameters to
be edited and recalibrated.

In order to refresh my memory I've just installed my copy of PCR1000BUR 1v2 and as I suspected there is a help file/manual built into the program.

There were other Backup/Restore programs, one at least of which came with a default EEPROM data file as a sort of "Get out of jail free card" for those who didn't have a backup of their own data, but I don't seem to have copies of any of these anymore.

There's a copy of PCR1000BUR 1v2 in the group files section. It's not the copy I installed so can't vouch for it but I'm sure it will be ok.
The software won't run if it doesn't find a PCR1000 to connect to, not even to allow the manual to be read.

I do remember now using this software before when I had my first PCR1000 and I've just used it to make an EEPROM backup of my current receiver, which is a very quick and easy process.
I generally use Icom's own control software, and Icom always insisted, in the past anyway, that an EEPROM could only become corrupted through using third party software, well the would wouldn't they:-), but there's no harm in having some insurance.

As an extra "bonus" I see from the manual that there's also an option to specify the "country code" when reinstalling the data so a possible instant coverage upgrade for some:-)

From: Fred
Topic: 6011 Message: 6053

If I had been doing some general HF/VHF listening I might well have noticed something but the most recent use I put the receiver to was testing the functionality of various programs.
By fortunate chance the query from Alan led me to try your program which revealed unsuspected EEPROM corruption. Some others who try PCR1000BUR might be similarly surprised.

Any input from other forum members?

Subject: Re: [PCR1000] Pcr 1000bur user guide

It wasn't like that, in general when your receiver got screwed you were not able to use it.

Now I can think of Icom finding what I called later the "crashed pattern" probably also as an average set of parameter but different batch of components might've transformed that set on the real "crashed pattern"

Then sure there are people like you with a crashed pattern and a working receiver while some others when the receiver got a corrupted EEPROM a mandatory recalibration was the only option... just an idea...

Pat

>Yes, the BBC Nanci Griffith version of the song is a favourite I viewed again recently and somehow paraphrasing the title seemed apt. But we have to bear in mind that the suspicion is pure conjecture without access to fact and those whose receivers were resurrected no doubt thought 50 euros very reasonable for the result.That my EEPROM content was so close to "crashed" yet remained working begs the question of what locations and values would would have totally disabled the receiver? And could that happening inhibit restoring content from a backup? My feeling is that the EEPROM could be scrambled yet the receiver remain viable to some degree. But I daren't test that idea!:-)Fred.

>>>>>>Hi Nigel,Too right about backing up.As a long term believer I back up anything needing backing up.Then I backup up the backed-up backup! :-)The EEPROM content was saved as soon as I became aware of BACKPCR around June 1996 and several further backups since may indicate when the data became corrupted. I go through phases of interest in listening and it may well have resulted from experimenting recently with PCR1000 programs that mainly didn't run well on Puppy Linux and Wine on a flash drive. Following your link and interpretation credibly explains why my PCR1000 showed no dramatic change in performance.   Bandscope and S meter sensitivity were reduced but not greatly, I didn't observe odd AFC problems and operation was not obviously impaired. I suspect that if my "crashed" EPROM content were loaded to another PCR1000 the result could be similar.What I now observe is that Bandscope amplitude is increased by perhaps a third,
indicated signal strength is a couple of S points higher on favourite local broadcast stations and displayed frequency accuracy is within a few hertz of zerobeat on USB/LSB.So far, so good :-)Fred.

Hi Fred

I was more amused than critical by the guy making the repair offer, although I'm still very sure my conclusions were correct, but if folks were willing to pay and, as you say, no doubt happy with the result, then good luck to him.

What made me smile was that by the time that post appeared in July 2005 Patrick's software, Peter Mahy's BackPCR, and other similar programs, had been available for 5 or 6 years, with the PCR1000 actually on the verge of being discontinued, so you'd think by then anyone on a PCR1000 user group in particular, which is where it appeared, would be well aware of the possibility and also of how to deal with it:-)

He does go on to list likely symptoms of a corrupt EEPROM, and from that it would seem that calibration issues such as yours, and in varying degrees of severity, were probably much more common than what might be considered total failure.

However, what I remember from the time this problem was first identified suggests that some "crashes" could indeed be just that, resulting in a receiver much less functional than yours was. I don't recall hearing of any that were beyond recovery but perhaps these extreme cases did require the full factory calibration.

I presume the possibility of greater damage lies in those "RESERVED" locations, but I certainly lack the courage to suck it and see:-)

regards

Nigel

Yes, the BBC Nanci Griffith version of the song is a favourite I viewed again recently and somehow paraphrasing the title seemed apt. But we have to bear in mind that the suspicion is pure conjecture without access to fact and those whose receivers were resurrected no doubt thought 50 euros very reasonable for the result.

That my EEPROM content was so close to "crashed" yet remained working begs the question of what locations and values would would have totally disabled the receiver? And could that happening inhibit restoring content from a backup? My feeling is that the EEPROM could be scrambled yet the receiver remain viable to some degree.

But I daren't test that idea!

:-)

Fred.

Subject: Re: [PCR1000] Pcr 1000bur user guide

That's a great paraphrase:-)

All the more so because "having a good old blether" is one of my wife's favourite expressions and/or pastimes, although I suspect she'd prefer the Nanci Griffith's version of the song:-)

I'm pretty sure there wouldn't have been any expensive test gear or a copy of EX2099 within a million miles, what they actually offered was....

"We include original & repaired eeprom on floppy/cdrom, and tuner alignment of the receiver is included in the service"

Which to me sounds very much like....

"We'll use Patrick's software to read your EEPROM data, replace it with his set of average data, and send you a copy of both, plus we'll also use his FFT option to adjust your reference crystal frequency, and that'll be 50 euro and thank you kindly sir" :-)

I could never understand why the price took such a leap, if the set had already been discontinued and that was the resulting speculative price from Ebay sellers etc it might have made a bit more sense, something like the silly prices again that the unlocked sets were fetching, but to double the retail price overnight was certainly an "interesting" marketing technique.

In a message dated 03/03/2013 18:03:15 GMT Standard Time, glenndriech@... writes:

To paraphrase from a Bob Dylan song; hoots of Spanish blether?
Yes suspicious considering the required test equipment, experience and time involved. Applying Icom's (leaked?) alignment program and procedure would be an unusual bargain if 50 Euros (even in 2005). I remember PCR1000s took a huge leap in price (doubled?) toward the end of manufacture and it's now become a classic used bargain. The instant I acquire another, first task....backup!!

And thanks to Alan's original post, I have / we have experienced the ongoing worth of Patrick's efforts.

For which much thanks!

:-)

Hi Patrick

I'd say it was pretty damn good:-)

Having the average data set was, and is, one heck of a bonus for anyone with a corrupt EEPROM who hasn't backed it up beforehand, but given that the original data from any PCR1000 is the specific alignment data for that particular radio taking a backup to start with is always going to be the best option.

With my first receiver I was very careful to back up the EEPROM once the option became available but must admit to becoming complacent with this one, I've had it for nearly a year and didn't even think about backing it up before the recent question about the manual, but Fred's experience has certainly shown the need is as strong as ever, especially if trying out different software options.

In my recent searches I came across a 2005 post to the group from Spain offering corrupt EEPROM repair plus "tuner alignment" for 50 Euro plus postage. They claimed over 30 sets had already been repaired. It sounds like somebody might have been putting your software to very profitable use:-)

Hi Nigel,

Too right about backing up.
As a long term believer I back up anything needing backing up.
Then I backup up the backed-up backup! :-)

The EEPROM content was saved as soon as I became aware of BACKPCR around June 1996 and several further backups since may indicate when the data became corrupted. I go through phases of interest in listening and it may well have resulted from experimenting recently with PCR1000 programs that mainly didn't run well on Puppy Linux and Wine on a flash drive.

Following your link and interpretation credibly explains why my PCR1000 showed no dramatic change in performance. Bandscope and S meter sensitivity were reduced but not greatly, I didn't observe odd AFC problems and operation was not obviously impaired. I suspect that if my "crashed" EPROM content were loaded to another PCR1000 the result could be similar.

What I now observe is that Bandscope amplitude is increased by perhaps a third, indicated signal strength is a couple of S points higher on favourite local broadcast stations and displayed frequency accuracy is within a few hertz of zerobeat on USB/LSB.

So far, so good :-)

Fred.

Subject: Re: [PCR1000] Pcr 1000bur user guide

Hi Fred

That certainly looks a lot closer to Patrick's average data, just as well you took the earlier backup, I wonder what caused it to change so much.

It's certainly a warning to all of us that backing up the EEPROM still isn't something to be ignored and I'm feeling much more at ease knowing I've done mine.

I was doing a bit more searching todfay and came across this page........

_http://geophysics.ou.edu/home/pcr1000/backup_eeprom.html_
(http://geophysics.ou.edu/home/pcr1000/backup_eeprom.html)

There's some reports on there that show EEPROM results from 14 different PCR1000s and also a calculated average for each location, which are encouragingly similar to Patrick's average values:-)

There's also the indication I was looking for of what each location represents and whilst some are just shown as "reserved", most seem to be reference levels for the S meter and band pass filter tuning points which might explain why a receiver showing very close to the crash pattern, as yours was, could still appear fully functional if nothing more critical had been affected.

My receiver serial number is in the 02300 range so would be concurrent
with when you wrote your program. It's encouraging that it has proved
reliable over 10 years or more. If being developed and you had been looking for
feedback I would have suggested that content and frequency adjustment
should not begin without warnings.

Can you clarify your meaning of "crashed", what the "smart set" is, the
simplest way possible to "adjust the frequency" and is the above what the
pattern typically becomes?

Meantime, I'll search for an EEPROM backup done with another program and
see if/how it differs. Hopefulluy any corruption occurred after I made
that backup.
It is interesting that in gereral usage nothing indicated any
strangenesses until today!

Regards,

Fred.

Subject: Re: [PCR1000] Pcr 1000bur user guide

I remember there was a pattern for the crashed PCR1000,
I wonder how your receiver works well if it has the values so identical
to the crashed pattern? it's very weird...

Of course all my statistical model was based on the early production
units, I really do not know if things changed on the memory mappings; but it is
still weird how close to the crashed pattern your values are...

you could very well apply the "smart set" of course you need to adjust the
frequency as that parameter had very high deviation. Then if you do not

like it you can restore your values from your back-up. I did it million times on my unit and I never crashed it once.

I have a pretty good record of more than 10 years with no-one telling me that crashed his box because of my soft ;-)))

Completing a bit the story, yes the initial mod was a comparing the different PCBs. The only difference were some surface mounted "resistors" operating as switches giving a hardware configuration. Next some Icom internal software leaked and the rest was easy... ;-)

Best,
Pat

Thanks Patrick,
I sometimes more enjoy getting things to work too :-)
Never had cause to fix my PCR1000 but followed temptation, installed and ran your program, backed up and compared the EEPROM successfully.

However, I was surprised that the EEPROM Analysis showed Crashed Pattern Matching = 99%, Values Out of Statistical Margins = 93%, Reference Frecuency Value = 128.
Following the "Advice: Your EEPROM shows the Crash Pattern, please apply an Smart Set Average Data" resulted in the EEPROM content being modified without warning and "Ref. Xtal Freq. Adj." required.

I then decided to exit, play safe and restored the EEPROM content to original.

The radio appears to operate as before but would you know if anything might have changed that I should consider?

Also, would the program be valid for later serial number PCR1000s as well as earlier (like mine)?

Regards,

Fred.

Yes it was like you say on those days,
after some time Icom released a "fixed" version covering the hole and the

mod wasn't possible anymore...
I have to say I got more fun programing that soft than listening to the receiver ;-)

Best,
Pat

It takes talent to write such a program and PCR1000BUR looks intriguing. Especially the implication of Nigel's observation about setting the "country code".

Does this mean that after backing up a cellular blocked US version PCR1000, if the country code is changed then the EEPROM contents restored, unrestricted frequency coverage becomes possible?

Regards,

Fred.

_____

Sent: Friday, 1 March 2013, 8:46
Subject: Re: [PCR1000] Pcr 1000bur user guide

Hi
I wrote PCR1000BUR some time ago;
yes the info on how to use it is within the program.
I remember the default parameters where taken from the statistic gathered from people's backup files.
There's only one parameter (frequency offset) that presented a huge dispersion then setting that from a default set of values will sure lead to problems.
For fixing that parameter the program included a module of FFT that help you to quickly and accurately calibrate the receiver frequency when tuning a standard frequency from a couple of satellites,... I'm pulling this out of my memory, everything is well explained within the software.

Best,
Patrick

PC1000BUR was/is a program writtten by Patrick Masotta for backing up and restoring the EEPROM calibration data in the PCR1000 to allow a corrupted EEPROM to be restored without needing to send the radio back to Icom.

It also allowed some EEPROM parameters to be edited and recalibrated.

In order to refresh my memory I've just installed my copy of PCR1000BUR 1v2 and as I suspected there is a help file/manual built into the program.

There were other Backup/Restore programs, one at least of which came with a default EEPROM data file as a sort of "Get out of jail free card" for those who didn't have a backup of their own data, but I don't seem to have copies of any of these anymore.

There's a copy of PCR1000BUR 1v2 in the group files section. It's not the copy I installed so can't vouch for it but I'm sure it will be ok.
The software won't run if it doesn't find a PCR1000 to connect to, not even to allow the manual to be read.

I do remember now using this software before when I had my first PCR1000 and I've just used it to make an EEPROM backup of my current receiver, which is a very quick and easy process.
I generally use Icom's own control software, and Icom always insisted, in the past anyway, that an EEPROM could only become corrupted through using third party software, well the would wouldn't they:-), but there's no harm in having some insurance.

As an extra "bonus" I see from the manual that there's also an option to specify the "country code" when reinstalling the data so a possible instant coverage upgrade for some:-)

I plead guilty but browsers can present differently and how convenient it is to be able to scroll down to review the content and trend of a topic - and perhaps save the text for future reference.

But this is a poor excuse for a bad habit and I shall attempt to comply accordingly.

Regards,

Fred.

6059. Bonito Software "Dongle"

Yahoo group: PCR1000
Date: 2013-03-27 16:11:15 UTC
From: jdocwra
Topic: 6059 Message: 6059

I own a PCR1000 which I've had for a number of years and which I've recently dug out again and got working in Windows 7 using the control software downloaded from Icom and a RS232 to USB adapter which works just fine. The PCR1000 came with Bonito Software and a "dongle' which you connected between the computer and the RS232 cable going to the PCR1000. I would like to try the Bonito software again, but the "Dongle" which was like a reversing RS232 connector has long disappeared and after 5 moves since I last used it I have no idea where it might be. Does anybody have any idea where I could obtain one?

Also I have noticed that when I switch to SSB or CW the sound appears to mute but I can hear stations using the AM, FM and wide FM settings just fine. Is there a fault here or is it that I just haven't heard any CW or SSB stations. I haven't yet rigged an external aerial.

Thanks

From: Mark J Culross
Topic: 6059 Message: 6060

jdocwra:

I don't know about the dongle, but I seem to remember that the muting in SSB/CW is a "design feature" of the Icom software whenever the spectrum scope is active . . . I'm old & something else that I can't recall at the moment . . . oh yeah, "forgetful" . . . so I may be mis-remembering this !!

If you'd like to try out yet another control program, look for PcrMC98.zip in the files section. If you like it, great !! If not, it cost nothing but the time to try it out.

Good luck & have fun !!

To decode DSTAR frames, you need a direct access to discriminator. (9k6 compliant).
The frames can be decoded with a little DOS program named DSTAR.EXE.
But, to decode vocal frames, you need to get a card with the AMBE codec.
It's an on-chip solution based on the AMBE Chip.
A USB dongle exists (I don't remember its name) , and some other solutions are available, as DVRPTR modem with additionnal AMBE card.
2 versions of ambe modem exists : the V1 (www.dvrptr.net) and the V2 (shop.dvrptr.de).

With one of these modems, a real 9k6 compliant transceiver becomes a DSTAR transceiver. I owned one, and it works perfectly.

You can have more explanations on the dedicated yahoo groups (dvrptr_V1 and dvrptr)

That's all I know about it .

Hi Bob,
In the data frame of DSTAR, you can see callsign, and data msg like aprs
, beacon text .
It depends on the data stream that the repeater or the mobile is sending.
You can find the DSTAR protocol here :

http://www.arrl.org/files/file/D-STAR.pdf

6074. PCR AnyWhere 2.2

Yahoo group: PCR1000
Date: 2013-05-01 14:58:15 UTC
From: Juan Carlos
Topic: 6074 Message: 6074

Hi,

PCR AnyWhere 2.2 is now available for downloading from our web page
http://www.pcranywhere.com

This version runs under Windows, Linux, Mac OS X and some ARM based
boxes (like Raspberry PI and CuBox).

It also offers a better experience when accessing remotely your receiver
and a higher stability and reliability in general, apart from some
other new functionalities and bug fixes. Check the release notes for
more details.

Your feedback is highly appreciated. We hope you will enjoy it.

Regards,
..JC

Hi,

is it just the meter or generally the reception?
Check the WEB for EEPROM corruptions.
Poor reception and no meter indication are typical for that.

Kind regards

From: k0fns
Topic: 6082 Message: 6082

I own a PCR100, and have been wanting to use it on my MacBook Air under OSX Lion 10.8.3.
I downloaded the Free PCR Anyware program, and it works!
I am using a USB to serial adaptor and it found it, and set it up for me.
They also have a windows and linux version and it will work for the PCR1000, PCR1500 and PCR2500 too.

Topic: 6082 Message: 6083

Hi Roy
I used to use an old windows 98 laptop that had a serial port to run my PCR1000 using software called TalkPCR which I found very handy to use.

Unfortunatly the hard drive went faulty and couldn't be replaced and the software was unobtainable.

This new package seems idea as it would allow the ICOM black box to be controlled with a more modern laptop.

Must try it later before paying for it

From: moveman60
Topic: 6084 Message: 6084

Hello everyone,
I tried to post something a couple of weeks ago, didn't seem to work. I have an ICOM 1000 and have used it for many years with an xp laptop. Now running on 7 and want to install Talk PCR. I can get it on there but it moans about missing files, missing cals missing all sorts. It will then run but I can't type anything in or do anything with it.
I have installed the ICOM s/w and that will not even let me change the com port, maybe it can't handle USB to serial, don't know.
My treasured ICOM 1000 is completely useless, can anyone help?

6085. How do I know if eprom is corrupt

I have not used the PCR1000 for some years ,I went out to the coast to do some shipplotting But I could not pick up any audio on the marine frequency or any ais traffic It was OK when I used it last .The only thing I managed to pick up was the BBC .I am not that clued up If the radio picks this up is it ok to receive all other traffic or can it be faulty .I suppose my question is ,is there a way to simple test the radio to see if all is working OK.
Please do not get to technical I have trouble with computer language. Thank you
regards David Wilson

From: Steve Cseh
Topic: 6084 Message: 6090

I think that you have a few things going on here. You have a Software compatibility and a USB to Serial Adapter Driver or COM PORT issue.

1. Did you install TalkPCR by right clicking on installation file and clicking on "Run as Administrator"?

2. Program Compatibility Wizard
I installed onto Win7 Pro laptop. Using Program Compatibility Wizard, I manually chose Windows XP SP2.

The following error boxes showed up:

Cal data file AM15.Cal not found
Cal dBm functions will not work correctly

Cal data file WBfb50 not found
Cal dBm functions will not work correctly

TalkPCR booted up, I had to run in demo mode, since my PCR1000 is not at work.
All controls appeared to work although I would be suspicious if some features like the Signal Meter may not.

3. Connect USB to Serial Adapter. Install Win7 or Vista version of driver.
Go to Device Manager (Right click on Computer on Start Menu)
Check under Ports (COM & LPT) to verify COM Port existence and setting.

4. Have you looked at a new PCR Program called PCR Anywhere?
http://www.pcranywhere.com

It installs on Windows 7 and looks very nice. It is free. You can connect to other PCR1000 radios on Internet.

Good luck

Steve

I think that you have a few things going on here. You have a Software compatibility issue and a USB to Serial Adapter Driver or COM PORT issue.

1. Program Compatibility Wizard
I decided to test this on my work laptop. No PCR1000 present.
I installed onto Win7 Pro laptop. Using Program Compatibility Wizard, I manually chose Windows XP SP2.

The following error boxes showed up:

Cal data file AM15.Cal not found
Cal dBm functions will not work correctly

Cal data file WBfb50 not found
Cal dBm functions will not work correctly

TalkPCR booted up, I had to run in demo mode, since my PCR1000 is not at work.
All controls appeared to work although I would be suspicious if some features like the Signal Meter may not.

2. Connect USB to Serial Adapter. Install Win7 or Vista version of driver.
Go to Device Manager (Right click on Computer on Start Menu)
Check under Ports (COM & LPT) to verify COM Port existence and setting.

Regarding the USB to Serial Adapter, I am using a Micro Connectors USB to 2 x DB9 Serial Cable.
It works under Windows XP, Vista, and 7 Pro.
The COM ports will change depending on the USB port that you are using.

Frys : http://www.frys.com/product/5814543
Amazon: http://www.amazon.com/Micro-Connectors-Serial-Adapter-E07-162/dp/B0032325LE
Microcenter :
http://www.microcenter.com/product/310981/USB_20_to_Dual_DB9_Serial_Adapter_1_Foot

3. Have you looked at the following alternative programs?

PCR Anywhere
http://www.pcranywhere.com
It installs on Windows 7 and looks very nice. It is free.
You can connect to other PCR1000 radios on Internet and control them.
You can share your PCR1000 on the internet.
This is the newest and looks pretty cool.

PCR Pro
http://www.fiftyonefiftysystems.com/PcrPro/PcrProScreen.html
Another Free Download. Jay Bray, author of TrunkPCR wrote this software.

KE7ATE PCR-1000 Signal Capture and Analysis Software
http://ke7ate.tripod.com/pcr1000sigcap.html
This is a $30 software package. It is more for analysis.

PROBE1K - PCR1000 software
http://www.probe1k.com/
This software is a DOS based software. It will run in Windows XP in a Command Prompt window.
Unsure if it runs in Windows 7. It is a very good software.
This is the most feature laden and there is a lot of intelligence built-in.
This is a $29.95 software product. Customer service is good.

4. Another solution is to run VirtualBox, VMWare, or Microsoft VirtualPC as a Virtual Machine, then install Windows XP in the Virtual Machine.
You can run TalkPCR in the VM if this is your software choice.

Good luck

Steve

6095. Bonito v6 by Radiocom

Yahoo group: PCR1000
Date: 2013-06-18 14:08:00 UTC
From: GMR
Topic: 6095 Message: 6095

I just purchased Bonito V6 RX/TX off ebay for $41. I took a chance not really knowing what I was doing, but it seemed like a good deal. I was just wondering if anyone is using it with their PCR-1000? In hindsight I realized that I don't kneed the TX, so I am wondering if it will even work with the PCR-1000? I won't be getting it for another couple days and was just curious about others experiences with this software. Thanks--Gary

I have been using Radiocom 6 for over a year. It is fantastic once you get it installed. You may not be able to authorize the software because you bought it second hand...(not sure)...anyway, i tried the free version i received with my prc1500...once i got it working, i upgraded for about 300.00 at dayton....well worth it...it covers everything....the manual isn't great...spend a lot of time learning it. many operation are available but you have to find them on your own...good luck

There is a special version for the Icom PCR-1000, is that the version you have bought?
That's not to say that other versions won't work, they may well do.
Check out the Bonito website for more info.

Bob.

Topic: 6095 Message: 6100

I went ahead and installed it and the Key was already in the software when I installed it. It seems to work for approximately 2 minutes and then the audio shuts off. The software stays up and running, but no audio. I can tune the radio, but no audio. I have adjusted the squelch, but still no audio. I am not a Ham so all the buttons are a little overwhelming, but it looks really cool, especially for $41. I wish it was the one specifically for the 1000. I will keep playing with it. Any suggestions would be appreciated.--Gary

Hi Gary

Did you get the hardware dongle with it?, Bonito calls it their "switchbox", and without that it probably won't run properly.
I think the version that was supplied for a while with the PCR1000 didn't need it but the Ham version certainly does.

Unfortunately, because the dongle has to be wired in with the PC to radio connections it's something that's more likely to either get discarded or left with the radio, rather than being kept with the software
As far as I can tell from the Bonito website the software needs to be registered online, even though it has that key built in, and there also seems to be restrictions that could make it quite difficult to register a second hand copy.
I think you should take a look around the Bonito site, check out what it says about the switchbox and also check out their FAQ page regarding registration, then perhaps contact them to see where you stand.

Regards

Nigel

Yes, the dongle did come with it. I will check out the registration tomorrow. Thanks for the help. I was so excited when I heard sound and then disappointment when it quit.

I am away at the moment so can't check but I have one of the version 5 cd for the Pcr1000.

It does need a dongle and bonito will sell different dongles for other rcxs. I was after one for an AOR ar5000. I do not know what you need for your set-up.

I was just wondering if anyone is using it with their PCR-1000? In hindsight I realized that I don't kneed the TX, so I am wondering if it will even work with the PCR-1000? I won't be getting it for another couple days and was just curious about others experiences with this software. Thanks--Gary

> Tue Jun 18, 2013 4:06 pm (PDT) . Posted by: "GMR" zon149ian I went ahead and installed it and the Key was already in the software when I installed it. It seems to work for approximately 2 minutes and then the audio shuts off. The software stays up and running, but no audio. I can tune the radio, but no audio. I have adjusted the squelch, but still no audio. I am not a Ham so all the buttons are a little overwhelming, but it looks really cool, especially for $41. I wish it was the one specifically for the 1000. I will keep playing with it. Any suggestions would be appreciated.--Gary

I just reeceived my RC 4.52 a few days ago and have had NO luck getting it installed! I have many different machines with different OS's on the and am very frustrated with Bonito. It's like they never tested this thing in the real world with a variety of computers. As I said I have may machines from dual core to quad core and have had the same reaction from them all. They tell me to go take a hike. They don't even SEE the radio and therefore won't load the program. I've tried it with and without the dongle that came with the PCR1000 (NO MATTER). I hope you have better luck than I've had. Please respond when you try to load your's.

I tried registering it on Radiocom's website, but it won't register, not surprised. I have sent an email to Radiocom to see how much I have to pay to get it registered. I will post more later.--Gary

I did not have any problems installing the software, but it only keeps the audio on for two minutes. I installed it on one computer running xp and one Windows 7. Same audio problems on both. I tried registering it with radiocom, but it would not accept it.

From: Jerry Ross
Topic: 6095 Message: 6107

I purchased RadioCom 5.1 a number of years ago when I was still working. It never would install correctly and there was very little assistance from Bonito. I eventually purchase RadioCom 5.2 in hopes that things would be better. Not a chance!
Everything went in a box and was put away and forgotten. Eventually I moved back to my home state and I decided to do some serious listening on the bands. Seeing that RadioCom was still the "premier" package to use, I purchased the RadioCom 6 upgrade. This time Bonito was responsive and made several attempts to get me online. In the end I told her that I was online but that wasn't true; I had enough and shoved everything back in the box and haven't touched it since.

The major problem that I see with Bonito is their extremely rigid and unforgiving registration and licensing method. Over the years that I tried to install this product I was I ever successful in registering this product through their licensing server; only by manually entering "keys" provided by Bonito. For the money they charge for their product they should be willing to allow their customer the freedom of using the product that they paid for.

Hi Gary,

Sorry to be the bringer of bad news but I was just looking round the Bonito site for something else and came across a page which states quite clearly that the "normal" dongle/switchbox won't work with the PCR1000 or PCR100......

http://www.bonito.net/service/xx_uni_swbx.htm

Seems a bit odd though that you did get it working, even if only for a couple of minutes, so it sounds more like a copy protection issue again rather than actual hardware incompatibility.

Regards

Nigel

poldhu1901@... wrote:

Hi Gary

Did you get the hardware dongle with it?, Bonito calls it their "switchbox", and without that it probably won't run properly.
I think the version that was supplied for a while with the PCR1000 didn't need it but the Ham version certainly does.

Unfortunately, because the dongle has to be wired in with the PC to radio connections it's something that's more likely to either get discarded or left with the radio, rather than being kept with the software
As far as I can tell from the Bonito website the software needs to be registered online, even though it has that key built in, and there also seems to be restrictions that could make it quite difficult to register a second hand copy.
I think you should take a look around the Bonito site, check out what it says about the switchbox and also check out their FAQ page regarding r egistration, then perhaps contact them to see where you stand.

Anything with a *legit* Prolific chipset works great. If you're any good
at soldering there's a direct replacement for the 9-pin Dsub that turns
it into a USB port, so you'd only need a mini-USB cable.

From: Mark J Culross
Topic: 6109 Message: 6113

sir_rayfrank (& anyone else looking for a USB-to-serial adapter that works !!):

Here's a repost of a message (with links updated to be current) that I have sent out in the past to several different Yahoo groups regarding a highly recommended (from my personal experience) USB-to-serial adapter:

Here's a product that I personally own & highly recommend for anyone that does not have a native serial port: Parallax (a well-known hobby company supporting all kinds of uP development support products & peripherals) offers a USB-to-serial adapter that works fabulously (I use it specifically under Win7, WinXP, Win2K, WinME, & RedHat linux). It also has the unique feature that it supports handshake signals (DTR for sure), as well as being USB 2.0 compatible. It is available in two flavors:

1) adapter only (no cable) for $14.99, stock #28030
    at
<http://www.parallax.com/Store/Accessories/CablesConverters/tabid/166/CategoryID/40/List/0/SortField/0/catpageindex/2/Level/a/ProductID/378/Default.aspx>

2) adapter plus 6 foot type A-to-mini B cable for $17.99, stock #28031
    at
<http://www.parallax.com/Store/Accessories/CablesConverters/tabid/166/CategoryID/40/List/0/SortField/0/catpageindex/2/Level/a/ProductID/379/Default.aspx>

The drivers for these adapters are available for download from the Parallax website at
    <http://www.parallax.com/tabid/530/Default.aspx>

I use it for all kinds of things on both my desktop & my laptops (HP, Gateway, Compaq, & Dell) & have NEVER had any trouble with it in any way. It might appear more expensive than your average USB-to-serial adapter, but when you consider the number of messages on the Yahoo Groups regarding "I just bought the XXXX USB-to-serial adapter & I can't get it to work . . . HELP . . . ", this is a product that is well worth the price in quality & reliability !!

Disclaimer: I have no connection to Parallax, other than the fact that I have bought MANY of their products (read that as having sent LOTS of well spent $$$ to them !!), & have integrated many of the items that they sell (both uP's & peripherals) in a large number of my hobby projects, and that I am a happy & continuing customer of theirs.

To keep this on-topic, I have personally used this USB-to-serial adapter extensively for programming my PocketTracker, my TT3s, & both of my TT4 beta units. As another example, I have also used it in combination with my simple CI-V cable to control my IC-756PRO, IC-7000, IC-706MKIIG, IC-R10, IC-W32A, & IC-T81, each using HRD, and I regularly use it to control my two PCR-1000 receivers.

I am using a Micro Connectors USB to 2 x DB9 Serial Cable. I can use two serial ports at the same time.

It works under Windows XP, Vista, and 7 Pro.

The COM ports will change depending on the USB port that you are using.

See links below.

I am using a Micro Connectors USB to 2 x DB9 Serial Cable. It has a USB port on one end and two DB9 Serial Ports on the other end.

It comes with a small Driver CD. It works under Windows XP, Vista, and 7 Pro.

Once the drivers are installed and your COM Port settings are setup to your liking, you always need to plug the USB cable into the same USB Port. The COM ports will change depending on the USB port that you are using. For example, one USB Port may give you COM 5-6, another may give you COM 7-8, or while a third USB Port may give you COM 9-10.

Because you will have two COM Ports, you can have PCR1000 control running while the second COM port can be used for something else.

Links below for the cable:

From: Mark J Culross
Topic: 6116 Message: 6118

Don:

Here is the latest version of the program that I wrote a while ago.
Note that this ZIP file is now also in the PCR1000 files section. It
is FREE, so please give it a try. If you like it, keep on using it. If not,
nothing spent, nothing lost !! The weakest part is the lack of a HELP
file. Instead, I put all of my work into the program itself, and did my
best to make it self-explanatory.

There are actually two executables included in this ZIPfile. The first,
PcrMC.exe is a DOS text-only version . . . it represents my original
program development. Much later in the development cycle, I
decided to implement the same capabilities in a DOS 640x480
graphical version as PcrMC-SA.exe. Both of these run very well
under multiple versions of Windows (Win95, Win98, WinME, Win2K,
WinXP, & Win7 . . . not tested in Vista or Win8) . . . PcrMC.exe
will run either full-screen or in a DOS window . . . PcrMC-SA.exe
will only run full-screen (Windows restriction).

The basic syntax to run the program is as follows:

```
   pcrmc[-sa]  [ -com1 | 2 | 3 | 4 ] [ -fast ] [ -debug ] [ filename ]
```

Note that all command-line options are case-insensitive.

[-com1 | 2 | 3 | 4] : you can specify the COM port on the command-
line to override that which is recorded in the PCRMC.INI file.

[-fast] : this will skip the pause on the "HELP" screen as the program
is started up.

[-debug] : this will cause a PCRMC.DBG file to be created that will
contain time-stamped entries for each command sent to the PCR-1000
and each status returned from the PCR-1000. Note that when the
receiver is used as a scanner, this debug file can grow quite large in
time !! Be aware of the disk-space requirements by running this for
a long time.

[filename] : you can specify the "program" file that you'd like
PcrMC to initialize with upon startup (it is not necessary to also specify
the file extension as this is assumed to be .PGM). See some of the
included "program" files for examples of how to make use of the
powerful capabilities within the PCR-1000 that Icom's included
Windows program woefully ignores and/or hides from us !!

Good luck & let me know what you like/dislike. It's been quite awhile since I worked on it, but updates are not necessarily out of the question. I definitely still use it all of the time. Even though it works especially well on very old (DOS-only) PCs (since that is what it was originally developed for), it works equally well under Windows (see above).

A couple of notes that may prove very useful are as follows:
ALT-H shows a help screen (the closest thing there is to a HELP file !!)
ALT-A goes into "automatic" (demo) mode which will let you exercise
          all of the program features even without your PCR-1000 attached
ALT-P starts/stops "program" mode
ALT-S starts/stops "scan" mode
ALT-Q quit without saving configuration
ALT-X exit & save current configuration

Pressing any of the selection keys (for example, O for mode) will cause that field to blink, indicating the selection that can be controlled using the up/down and/or left/right arrow keys to change the selection. Press the ENTER key to complete the selection for that field.

Frequency information can be entered anytime that no other fields are already active (pressing F first is not absolutely necessary). When entering frequency information, you can also use the backspace key to make corrections. As well, you can use the ESCAPE key prior to hitting the ENTER key in order to discard any frequency changes made and return to the previous frequency setting.

Some keys take effect immediately (typically those that alternate between two settings) such as G for AGC on/off, B for NB on/off, etc. Some keys have multiple functions (but with related control) such as P for bandscope...pressing P once will let you select the bandscope speed...pressing P again while the bandscope selection is active will change the bandscope vertical resolution multiplier.

Feel free to e-mail me if you have any questions, comments, and/or suggestions for improvements.

Have fun !!

Ken, Others,

Yes! I have now tried it with XP virtual mode.
It still doesn't work! I can get the software to load & boot, but the serial port doesn't connect.
When I plug in the usb - serial, it automatically selects com port 3! If I select from the PCR1000 software any other com. port still no connection! How do I force the usb - serial device to com port 1 or 2?
PCRAnyWhere is running on com port 3 okay from Windows 7, so I know the usb - serial device is working!
Thanks for any help, Don

```
This is just an assumption, but this is what I would try:
Start - Settings - Control Panel - System - Hardware -
Device Manager - Ports - Com Ports - Communications Port(Com ?) -
Port Settings - Advanced - Com Port Number drop-down box -
Choose Com1 or Com 2 - OK out of each box.
Like I said:  Just assuming......
Luck,
Ken.
I'd re-start too, just to see if it sticks.   :)

Hi Mick, when I answered your original question, I should have said copy the MCH directory, not the individual files.
This is what I would do:
Copy the MCH directory from the old computer to a USB device (stick), then overwrite the MCH directory on the new installation with it.
That worked for me.

Good luck.

H Bob & Jay,
Thanks for your replies.
Here's the story so far:
I installed the software on my replacement computer. I then went to program files - Icom - PCR1000 and pasted all the old MCH files from my old machine. I then ran the program but there were no stored frequencies. I opened the MCH files using notepad and all the info is there but the Icom software just won't find it. I can write to the memory and save a new file and that's fine. Very odd.
An ideas>
Mick

Hi Mick,

Just copying the MCH files to Icom's folder (C:\Program Files\Icom\PCR1000) won't do you any good until you load them into Icom's program, ie: File Menu -> Open.

It won't scan the install folder for MCH files for you...

Then after you save the settings or close the program, the "PCR1000.ini" file will be updated to reflect your current MCH file...

In the "PCR1000.ini" file, the current MCH file is stored as: (EXAMPLE)
MEMFILEPATH="C:\Program Files\Icom\PCR1000\Noname.mch"

H Bob & Jay,

Thanks for your replies.

Here's the story so far:

I installed the software on my replacement computer. I then went to program files - Icom - PCR1000 and pasted all the old MCH files from my old machine. I then ran the program but there were no stored frequencies. I opened the MCH files using notepad and all the info is there but the Icom software just won't find it. I can write to the memory and save a new file and that's fine. Very odd.

If you are using Firefox and detest the new Neo look to Yahoogroups web interface there's a plugin
available that reverts everything back to the old style, no idea how it works but it does! I'm using
it here, no alarms bells sounded when I installed it, can't see anything dodgy about it and all
reviews are good. http://ehibbert.org.uk/extension/install.html

From: robert.mc@att.net
Topic: 6143 Message: 6143

Hi Guys,

Have had myPCR1000 in semi storage for some years and recently took it out. Popped the cover off to check things.

Remembered it had a small PCB add on board plugged into "J12" "OPT2". The board is stuck to the RF cover. Only ID on the board is B5051B.

Anyone have an idea what this board is and does? Could find no reference to it with many searches.

This is definitely not the UT-106. The 106 ribbon cable plugs into J3. Thi ribbon cable for this mystery board is into J12 over on the side of the logic board near the packet connector.

No new windows seem to be enabled in PcPro. Suppose I could unplug it and see what changes. Thought it might be some add-on to give units sold outside the US some capability the US models had, but no idea what those might be.

Never knew of the Pcr1000 having a voice synth before, or how you would activate it. Had one for my R7100, but found it useless with a very slow response reading out the frequency the radio had stopped on.

Suppose I could upload a pic if that was possible here.

Nope, not hooked up like an UT-106 or look like one, and if it were a version of DSP, it does not show up as an option on any software operating things.

FWIW, The schematic shows the J12 pins as:

GND
WFDT
L+5
DRES
UTO
UT1
OPLK
OPCE
OPDI
OPDO
OPCL

Rereading the "snippets" I caught his mention of Pin 11 on J12 as having the Wideband discriminator data on it. Perhaps this is what WDFT stands for?

OK, if this is correct, what would this board do with it?

Since this is a software operated radio, something must come out that some software takes advantage of, or the thing is as useful as an appendix.

With a little more digging, it looks like this board is for something to do with FM digital multiplexing, so called DARC format.

Looked up the large chip, LC72706 and went from there. Guess it was someone's great notion that never got much traction, least I have not heard of it. Sure do not need anything like that.

Just pulled the thing out. Anyone wants it to play with, pay for postage and it is yours.

With yet more digging, I found this is an Icom UT-107 DARC option. It does show up on PCR Pro if you hit F12 as DARC "YES". Since this is a low SN PCR1000 01310, it may have come from Japan, hence the UT-107.

If any of y'all want to Paypal me $25, that should cover putting it in a static free bage and small flat rate box shipped to anywhere on the mainland from here in Hawaii.

I have a IC-R2500/PCR2500 with the 3 big options installed.

UT-106 DSP UNIT
Provides noise reduction and auto notch functions. UT-118 D-STAR DIGITAL UNIT
Provides D-STAR DV mode reception. Either UT-108 or UT-118 can be installed in the receiver. UT-122 P25 DIGITAL UNIT
Provides APCO P25 digital mode reception I still have the original box as well as all the manuals, remote control head and cables.

It is in original shape, no scratches, no damage and works perfectly.
p.s. this has no blocked out frequencies, it is straight through coverage from bottom to top.
Also included will be my copy of PCRPro and TrunkPCR with my registration key.

Not cheap, but worth it. $1500.00 US, payment needs to be through PayPal (same email address)
If you need to see it, I could put a video of it on youtube.com

Send an email to richard.morris@cox.net

Icom PRC-1000, I have the power supply, manual, and original software. In the PCR-1000 folder is a modification sheet, I am not sure if the modification was made or not. The unit looks very clean and works as it should. I talked to Jay, I might be a little high on the price.

If it has the original box, original antenna, a UT-106 DSP Module and unblocked in the 800mhz band, it could fetch $300 or more. If not, you would be looking at $150 to $250 (maybe a little more if you have a few bidders)...

Dan:

If I recall, software can send the characters "G4?" followed by CR/LF to the PCR-1000, & a US/UK version should reply with "G410". From what you report, it seems that your PCR-1000 is responding with something other than the expected "G410". Is your unit a US/UK model ??

>Mark J CulrossHope that helps . . . As another alternative, if you are running Win7Pro, you could download the free WinXP virtual machine from Microsoft & try running your scope software under that WinXP virtual machine to see if that makes any difference.For more advanced troubleshooting, you could start up HyperTerm or another terminal emulator program if you have one . . . using the same COM port that you are connecting to your PCR-1000, set it up for 9600-8-N-1 & type "G4?" (without the quote marks) & hit return to see what the PCR-1000 responds with.

I have used the PCR 1000 with Windoze XP,Vista and Windows 8 without problems. I use a USB to Serial cable adaptor (IO Gear model # GUC 232A),that windows has no trouble with for the PCR1000 (or an old Garmin GPS and other things I used it with). You just need to set your Com Port to the right one. Sometimes trial and error is easiest here, depending on your frustration tolerance level. Icom seems to have done OK with the hardware side of things with this receiver. Too bad they don't put the engineering into their software that they do the hardware...
Good luck

6176. Re: [PCR1000] RE: driving pc ???

Yahoo group: PCR1000

From: Mark J Culross
Topic: 6174 Message: 6176
Attachments: 1 described; binary payloads are missing from this source WARC

If you are looking for software with better PCR1000 control,
here is the latest version of the program that I wrote a while ago.
Note that this ZIP file is also in the PCR1000 files section. It
is FREE, so please give it a try. If you like it, keep on using it. If not,
nothing spent, nothing lost !! The weakest part is the lack of a HELP
file. Instead, I put all of my work into the program itself, and did my
best to make it self-explanatory.

There are actually two executables included in this ZIPfile. The first,
PcrMC.exe is a DOS text-only version . . . it represents my original
program development. Much later in the development cycle, I
decided to implement the same capabilities in a DOS 640x480
graphical version as PcrMC-SA.exe. Both of these run very well
under multiple versions of Windows (Win95, Win98, WinME, Win2K,
WinXP, & Win7 . . . not tested in Vista or Win8) . . . PcrMC.exe
will run either full-screen or in a DOS window . . . PcrMC-SA.exe
will only run full-screen (this is a Windows restriction).

The basic syntax to run the program is as follows:

   pcrmc[-sa] [-com1 | 2 | 3 | 4] [-fast] [-debug] [filename]

Note that all command-line options are case-insensitive.

[-com1 | 2 | 3 | 4] : you can specify the COM port on the command-
line to override that which is recorded in the PCRMC.INI file.

[-fast] : this will skip the pause on the "HELP" screen as the program
is started up.

[-debug] : this will cause a PCRMC.DBG file to be created that will
contain time-stamped entries for each command sent to the PCR-1000
and each status returned from the PCR-1000. Note that when the
receiver is used as a scanner, this debug file can grow quite large in
time !! Be aware of the disk-space requirements by running this for
a long time.

[filename] : you can specify the "program" file that you'd like
PcrMC to initialize with upon startup (it is not necessary to also specify
the file extension as this is assumed to be .PGM). See some of the
included "program" files for examples of how to make use of the
powerful capabilities within the PCR-1000 that Icom's included
Windows program woefully ignores and/or hides from us !!

Good luck & let me know what you like/dislike. It's been quite awhile
since I worked on it, but updates are not necessarily out of the question.

I definitely still use it all of the time. Even though it works especially
well on very old (DOS-only) PCs (since that is what it was originally
developed for), it works equally well under Windows (see above).

A couple of notes that may prove very useful are as follows:
ALT-H shows a help screen (the closest thing there is to a HELP file !!)
ALT-A goes into "automatic" (demo) mode which will let you exercise
          all of the program features even without your PCR-1000 attached
ALT-P starts/stops "program" mode
ALT-S starts/stops "scan" mode
ALT-Q quit without saving configuration
ALT-X exit & save current configuration

Pressing any of the selection keys (for example, O for mode) will cause
that field to blink, indicating the selection that can be controlled using
the up/down and/or left/right arrow keys to change the selection. Press
the ENTER key to complete the selection for that field.

Frequency information can be entered anytime that no other fields are
already active (pressing F first is not absolutely necessary). When
entering frequency information, you can also use the backspace key to
make corrections. As well, you can use the ESCAPE key prior to
hitting the ENTER key in order to discard any frequency changes made
and return to the previous frequency setting.

Some keys take effect immediately (typically those that alternate
between two settings) such as G for AGC on/off, B for NB on/off, etc.
Some keys have multiple functions (but with related control) such as
P for bandscope...pressing P once will let you select the bandscope
speed...pressing P again while the bandscope selection is active will
change the bandscope vertical resolution multiplier.

Feel free to e-mail me if you have any questions, comments, and/or
suggestions for improvements.

Have fun !!

Mark, I tried your program under windows 8.1. 64 bit in a "dos box", command prompt window and it wouldn't run. I'll load windows XP later and try that. Maybe a VM with a DOS program running would work on 8.1/64? I'll play some more with it later. Right now though, the fish in the lake are calling my name! Like you said, Have Fun!

I'm glad you mentioned trying my PcrMC program in a "dos box" under 64-bit Windows . . . I had forgotten that Microsoft does not allow this (personally, I believe that this is a "business decision" problem, not a "technical" problem !!) & I need to add this note to my "standard text" that I sent to you & that I send out each time I recommend my PcrMC program to someone looking for more PCR-1000 control than allowed by the limited software that Icom supplies !!

Thanks again & good luck with the fish . . .

Did you install the drivers before connecting the USB to serial device?
I don’t have Win 7 or above but the drivers should be installed first or if the instructions will say to put the driver disk into a drive and then connect the USB to serial device. Win should find the devise and them look for a driver, if the driver is found Win will install it. Be sure to use the same USB socket or you may have to reinstall the driver again.

I see two USB to Serial adapters from Pafaso on amazon for $2.51 and $2.67. Neither of these show a Support CD that is included, just the adapter...

You should contact User "Pafaso" on Amazon and request a driver for Windows 7...

Jay

I bought the "serial to USB" cable from Amazon; mfg # PAFASO and can't get it to work....selecting any COMM port via the PCR-1000 I get a message "Comm port error"....maybe it don't work with Windows 7 on my Toshiba laptop?

Thanks for any suggestion.

I received a reply from an Amazon customer indicating that since it is a Chinese product, this one has no website nor support for the cable...will have to find out from our readers who have a working "serial to USB" cable and what brand and the drivers for it..this .Amazon cable goes into my "junk box".
Waiting for more suggestions...
Tony

I got a 2nd hand windoze 7 laptop recently and had problems until I found that if the radio power is already on when the laptop boots up with the cables connected. I have few COM Port Errors once it has been configured the first time. I use an old IOGEAR GUC232A and it has worked with several old devices on PC's running everything from windoze 98 to windoze 8.1 without trouble unless I hadn't configured something right.

Yes, but make sure that you get an adapter which supports the serial handshake signals...specifically DTR & RTS (iirc). There is one that I have used personally with much success available from Parallax. You can offer them specifically with or without the usb cable.

Hi,
I had trouble, but with the software. Icoms own wont work at all, Talk-pcr works for a while, then craps out. HRD worked fine with me. Tried all that on 2 pc's with 2 different OS. Lucky for me, my motherboard had a COM port header.

Greetings all! Don't know if this question arose before, but will a "serial-to-USB" cable work with the PCR-1000 on computers that do not have a serial port?
Thanks.

Dave:
Sounds like your experience matches what I experienced as well. The PCR-1000 expects a handshake signal to be continually asserted (I think it is RTS, but it might also be DTR . . . I'm away from my computer at the moment, so I can't confirm) . . . without that signal, the receiver will go back to idle mode.

Way back when I first bought my receiver, I wrote my own program to control it (PcrMC & it's available in the files section of this group) & I had to account for this required handshake signal.

The exception I have run into is a program called Field Analyzer PCR1000, a signal strength collection program. Works great on my old COMPAQ laptop with RS232, but making it work with a USB-RS232 cable I had "no joy".

If anyone knows of a more recent version of this SW that works. please let me know.

6204. PCR100 strange I1? query signal strength

Yahoo group: PCR1000
Date: 2014-09-05 16:21:20 UTC
From: hhbell370@...
Topic: 6204 Message: 6204

I am using a pcr100 to provide a streaming WWV audio on my website. At one time I had it set to tune to 2.5, 5, 10, 15, and 20Mhz and do a "I1?" command to which I got the signal strength. Something has happened to the radio or my program (if it's my program I can't find it after many hours of searching) that has it returning a value for signal strength when tuned to 2.5mhz but only returns I100 when tuned to the other wwv frequencies. This sudden change in response means I have to try to check the tunning every once in a while to keep the most clear frequency going out over the internet audio stream (unreasonable - unreliable). I cannot understand why when I do my scan every 20 minutes the first frequency returns a sig strength and the others return I100. Any help would be appreciated.

Hi,

I1 command is very closely related to squelch on the pcr100. Make sure that you send a J4100 command after you power on the receiver and maybe before the I1?

Thanks for the response. I tried placing an open squelch command between the change in freq and the I1?. Unfortunatley it did not make a difference. I'm stumped. I have thought to find an authentic copy of the eeprom and reload it to be sure mine is not corrupt but I cannot find one on the internet.

Have you changed the computer hardware? Are you now using a USB interface?

I have found that some programs dont get along with the USB for some reason, probably timing related.

Hi Buddy,

Have you tried monitoring your scanning frequencies using Icom's program or a different one to see if you get the same results?

If you're still scanning the WWV frequencies, not all of them are active at the same time anymore...

I am using usb serial adapter on unbuntu and a homebrew java program. I have seen a couple of responses indicating that the usb adapter may be to blame. I have come up with an alternative method of determining the best freq by creating a waterfall display of the signal. A good freq produces a unique pattern that is easy to identify with an ad hoc piece of code. Thanks for the help.

TrunkPCR version 1.00.290 Now Available for Downloading from the Homepage:
http://www.fiftyonefiftysystems.com/TrunkPcr/TrunkPcrDwnld.html

NOTE: Moto Type-I Support *should* be finished in the next major update.

This update has 16 Fixes, 8 Changes and 8 Additions...

Aug 09,2014 - Fixed: Initilaizing D-Star & P-25 Dialogs.
Aug 09,2014 - Fixed: D-Star - Decoding a new NMEA Message Format.
Aug 21,2014 - Fixed: D-Star - Reporting Emergency Status.
Aug 21,2014 - Fixed: D-Star - Displaying Lat & Lon Coordinates of UnKnown
Caller.
Aug 27,2014 - Fixed: Bug in Comm Routines for Commands with length > 5.
Aug 30,2014 - -----: D-Star "EMR" and "BRK" Messages now Shown Correctly.
Aug 30,2014 - -----: D-Star Caller Status "UR?" and "RPT UP" now Shown.
Sep 16,2014 - Fixed: CTCSS/Dual CTCSS Search for PCR-1500/2500.
Sep 17,2014 - Added: Dual Squelch Display Status.
Sep 20,2014 - Fixed: Display of Dual DTCS Squelch Status Color.
Sep 20,2014 - Fixed: Display of Dual CTCSS Squelch Status Color.
Sep 20,2014 - Fixed: Display of Dual Voice Squelch Status Color.
Sep 20,2014 - Fixed: Using Dual DTCS Squelch.
Sep 20,2014 - Fixed: Using Dual CTCSS Squelch.
Sep 20,2014 - Fixed: Using Dual Voice Squelch.
Sep 23,2014 - Fixed: DTMF now Enabled for Main Receiver on a 2500.
Sep 23,2014 - Fixed: Using DTMF on 1500/2500.
Sep 23,2014 - Added: About Dialog now shows if Dual DTMF is Installed on
a 2500.
Sep 24,2014 - Fixed: Saving Dialog Window Position when Closing and
Minimized.
Sep 24,2014 - Added: Clear Current History function to Main & Dual DTMF
Display.
Sep 24,2014 - -----: Increased Main & Dual DTMF Display to 14 Characters.
Sep 25,2014 - -----: CTCSS and DTCS Searches will Now Only Work when in
Manual Mode.
Sep 25,2014 - -----: Scan Resume Now Sets DTCS Tone from Current Channel.
Oct 12,2014 - Fixed: Displaying CTCSS or DTCS Tone Frequency in Status
Panel During Scan.
Oct 12,2014 - -----: Changed Verson Number of TrunkPCR to 1.0...
Nov 03,2014 - Fixed: The DV Callsign Was Appended to Itself Each Time The
Bank was Switched.
This Created a Long String of Text that was Sent to
the PCR, Causing a
BIG Delay while Scanning as the String Kept On
Growing.
Nov 10,2014 - Added: Registration Information Can Now Be Copied to the
ClipBoard for Pasting.

Nov 12,2014 - Added: Clone Operation For PCR-1500 & PCR-2500.
Nov 16,2014 - Added: D-Star Messages Now Shown in Main Display (Besides in StatusBar).
Nov 18,2014 - Added: Duration of D-Star Message Display Setting (1 to 60 Seconds) After Call Ends.
Nov 22,2014 - -----: Changed COM Port Initializing / Startup.
Nov 22,2014 - Added: Detection of USB Power Failure for PCR-1500/2500.
Dec 04,2014 - -----: In COM Port Settings, "RAISE DTR" MUST BE Enabled for PCR 1500/2500 Cloning!

Version 1.00.290 Released 12/08/2014

IMPORTANT: If you have Upgraded ICom's Driver to Version 2.20, then you will need
to Check the [Ignore CTS] CheckBox in the COM Port Selector BEFORE Clicking the
[Power] Button...

6225. Faulty 10.25000 Xtal?

Yahoo group: PCR1000
Date: 2015-01-28 12:46:16 UTC
From: bobwarrin2009@...
Topic: 6225 Message: 6225

Hi All, over the years I've repaired/realigned/tested Icom's IC-PCR1000 for friends, relatives and fellow SWLs.
Never had any problem setting up these receivers using Icom's own software, but I have one that is causing a bit of a headache.
The problem is setting up the Ref Xtal to exactly 10.250mHz, the radio works fine but is out by a few hundred Hz on all the HF frequencies.
When using the software to try and correct this, I find that the Xtal can't be setup correctly...at 0 the frequency is 10.25007 mHz at 128 the frequency is 10.25020 at 255 the frequency is 10.25032.
My guess is that the Xtal is out of spec, so my question is:
Is the Xtal (CR588) available as a spare, if so, has anyone replaced it with success?
Any advice would be much appreciated.
Rgds Bob Warriner.

Hi Mark.
What OS are you using on the laptop.
If it's Windows7 try starting the program in compatibility mode...say XP.

Dunno if it can be sourced or replaced safely. I have the same issue, and it is a pain to save VHF and UHF frequencies with an offset to account for the 10.25 MHz not being correctly set.

Will watch to see if anyone has been able to replace it.

Thanks for getting back to me...I'm using a HP Envy TS 17 laptop, 64 bit operating system, Window 8.1. Prior to this laptop I used a tower with XP and everything worked great. Now I use the correct adapter connection (serial to USB) and when I turn the PCR and program, I can hear the handshake and then nothing happens. I spoke to ICOM and they said PCR is to old or v1 of the PCRs and wont work with the new technology. They at ICOM did not want to offer to much advice fearing liability. I think it will work, another person mentioned shorting out pins #7 and #8 in order to make it work. Before that I'm hoping someone in the group has run it the same problem and will offer up a solution.

Mark

Hi Mark,

Have you tried any other program, other than Icom's?

PCR Pro (one of my programs) has a debug feature that will let you see the COM messages to and from the PCR. By looking at the messages, it could tell you what's going on...

Regards,
Jay

Hi Mark,

I recently put a PCR1K (new version that came with the FM RDS daughter board) back to active rotation. Bought several USB-RS232 cables. All of them failed to work with an old laptop (no serial port) w/ old Vista.

I haven't tried shorting pins 7 and 8 on the serial line though. First time I've seen that recommendation. Might try it some time, when I get the courage to meddle with RS232 voltages (12V, enough to kill both PCR and laptop if I mess up and I do mess up!). My understanding is that this will disable handshaking. Old generation PCR's sent some signals through the RTS and the pc/laptop must be able to respond to that signal. RTS is also needed to be held high, so that the PCR does not auto power down (AFAIK after 20secs).

In the end, I bought a really old Toughbook w/ Windows XP loaded. (Oh the things you can find at Akihabara). This laptop has a serial port built in. With this laptop PCR works with all the software I try to use. No surprises there. I've set up Puppy Linux and using fldigi on this laptop with another radio (AOR AR-8600).

Mark:

Am I to understand that your still have your old tower computer? Is the USB-to-Serial converter new? Or did you use the same converter on your tower computer? The previous reply is also accurate - it could be that the software that you are using is not fully compatible with Windows 7 or 8/8.1.

Your issue is most likely either the software not being compatible or the software not working properly with the GUC232A. While that is a highly compatible converter, I have experienced several issues with it, chiefly the absolute refusal of several radios to work with it. I'm not trying to push you down the "use my preferred adapter" route. But I can tell you that the GUC232A can have issues. That's why it's important to know if that adapter works with your radio and the old tower computer. Once we can eliminate on thing, we'll get closer.

Also.... try connecting at 9600 bps if the software allows it. While you cannot use the bandscope functions at that speed, it might work at the lower speed.

Hi Robert, yes, it seems it’s not readily available which is a bit of a surprise since it is only a standard miniature Xtal nothing special size wise.
Anyway, as the Xtal is 20/25Hz high, I’m going to experiment with adding a small pf trimmer across it to see if I can pull it down a bit.
I know I have some of these in my workshop somewhere...but can’t find them, so had to order some, I will post the results of any improvement.
As these receivers are getting on a bit, I foresee this as a problem for most users in the future, so this mod might become useful for those that like to have their receiver spot on frequency.

No, I do not have the old tower; I am using the new laptop…business trips…The USB to Serial Converter is the same that was used with the tower. I have gone to the company web site and downloaded the exe files for that converter. Regarding your “preferred adapter route”, I’m willing to try anything to make the PCR work. Send me the name of your preferred adapter. I’ go into the settings and try the connection at 9600bps. Thanks for all your advice, I will keep you posted.

I just went to the software page for UTEN USB and downloaded there latest software drivers. I attempted to connect using Ham Radio Delux, it went through the whole process, port (4) is correct, speed (9600mps) is good, tried both DTS and RTS modes and nothing, I still hear the familiar handshake for the connect but no connect.
Something is just not right we'll keep playing with ideas, it wants to work.

It's been awhile since hooking up my PCR 1000 and I've had some communication problems with both my windoze 8 64 desktop and my windoze 7 64 Acer laptop out in the shop. I ended up getting it to work by hooking up the adaptor and then either turning on the software, THEN the radio OR the other way around. Sorry, I don't remember which way it worked. I use an old serial to usb 2 adaptor and I downloaded the newest drivers I could find. I have an early radio. I've had to work through comm problems with about every new version of windows as they appeared.
I'll try it again and get back with my results.

If I'm not mistaken I don't think you can run the PCR1000 on a 64bit computer running Windows 7. I don't know how, but I believe you can run it at 32bit. Try googling.
I had the same issue, but as I have Mac I run it on XP using Parallels.

Thanks Pete, looks like it might be what I'm looking for but I can't get past the hardware detection screen. It finds my PCR and skips through stations it can find, progress bar reaches 100% but then it just sits there and next is greyed out. Any idea what is wrong?

Sorry Mark don't have my PCR1000 anymore, sometimes i regret selling it, there is a forum assosciated with this software i believe, maybe worth trying there.
I may be tempted to get another PCR1000 if it was at the right price.

My PCR 1000 is running on an Acer 64 laptop with windoze 7 for me right now. Works fine as long as I have the adaptor plugged in and "box" powered on before starting the Icom software on the laptop. Also works fine on my windows 8.1 desktop, too. I've used it on about every flavor of windoze except windows 2K successfully.I use an IO Gear GUC 232A adaptor. An old one I bought for a Garmin GPS back when they had DB9 serial connectors instead of the mini USB connectors. Brian kc7dax

6253. Adding a UT-106

Yahoo group: PCR1000
Date: 2015-03-10 07:39:07 UTC
From: jeh@...
Topic: 6253 Message: 6253

I have a PCR-1000. I also have a UT-106 that I could install in it.

Is it worth it? I see many comments around that the UT-106 didn't really do much for e.g. the R75.

Also, once the UT-106 is installed, will "DSP control" options just magically appear in the IC-PCR1000 program? (revision 2.0) The installation guide for the DSP seems to imply that it will, but isn't specific. Or will I need some other program like TalkPCR?

6254. Re: [PCR1000] Adding a UT-106

From: Mark J Culross
Topic: 6253 Message: 6254

I have installed the UT-106 in a couple of my PCR-1000s & it is a nice addition. My experience was that the additional dsp functionality showed up automatically. When queried for status by the software, the PCR-1000 reports the presence of the dsp module & the software uses it.

UT-106 is mostly effective on HF, to cancel some of the
noise and spurs. Makes the '1000 a modest but usable HFRx.

6258. Mic socket input control

Yahoo group: PCR1000
Date: 2015-04-16 15:38:24 UTC
From: mike.german@...
Topic: 6258 Message: 6258

Hi, I want to use talkpcr to decode things like SSTV, POES and for meteor scatter. For a start I have had no luck trying to get this to work in any OS above XP (But this is not the question/problem). So I have set up a laptop (DELL VOSTRO 1710) with XP Pro SP3. Here is where the problems start: the Dell only has a mic socket for input and I can't work out how, via XP, to get the audio to feed to a program such as MMTV or Spectrum Lab. I have looked back at previous postings but found no solution. The PCR1000 works OK and is controlled properly via TalkPCR on the laptop. I hope this is a common teaser and others have found a solution. I welcome the advice of the group on this.

From: Mike Durff
Topic: 6259 Message: 6259

Hello, group members. I brought out my trusty PCR-1000 to test the other day. I haven't had it on in over a year. The last time I tried to use it, it seemed to be deaf. I blamed it on the makeshift wire antenna I had strung in my attic. Today,(4/15/15) I took it out to my ham shack and connected it to my old Cushcraft R-7 vertical. Tuning around the bands, there wasn't much to be heard... even the preachers who seem to be on the air 24/7 were not found. I finally tried WWV on 10 & 15 mc, and it was barely readable on both freqs. I tried another antenna, a 20M bobtail curtain with similar results. Finally, I flipped on my WW2 vintage RBC receiver. Loud signals were heard on 20M CW & SSB with both antennas.
I'm running the ICOM software on my old HP laptop running XP.
any ideas anyone ?

Can you not use the discriminator output (packet) and input to the mic-in on the laptop , it worked for me when decoding digital speech with DSD+.
Experiment with the input levels.
I don't have the PCR1000 any more regretfully!

Hi Mike,

I haven't used XP in a long while. What you're trying to say is that, the application can not select the default I/O devices you have?

You mentioned "Spectrum Lab", is this SpecLab (http://dl4yhf.darc.de/spectra1.html)? Because I've played around this application for a bit. Can't you see the audio device in the "Audio I/O" tab "Configuration and Display Control"? Options -> Audio settings, I/O device selection from the menu.

The other option is to buy one of those cheap, plug and play USB sound cards!

72,
Rommel

Don't worry about not being able to receive WWV if you are UK or European based.
I have a Racal RA-1772 and a Wellbrook steerable loop antenna, and I haven't been able to either for the last few days/weeks, poor propagation at the moment.
Bob(UK)
PS: Russia pours in on 9.996 and 14996 however.

Goodluck!

The external USB sound card I have shows up as a Mic and a Speaker on the OS. I just let the software use those devices for I/O.

The card that I use is a $15 Chinese-made dongle, off the streets of Akihabara. It shows up as "C-Media Headphone".

Topic: 6258 Message: 6270

OK, the question at hand is are you having trouble the program to see your audio card or are you having trouble getting the audio card to see the microphone input?

If it's a matter of getting the program to see the audio card you do that from the options menu of spectrum lab.You select the audio I/O options from the menu and from that you can select the audio device.

If it's a matter of selecting the correct input, you would use the windows volume application which is located in accessories menu item on the entertainment sub group if it's not on your taskbar. once you open the volume control select the "options" menu and select properties from it. open properties is open you click on the "recording" button and from there you should be able select your active input and set levels. The one caution is that many current laptops have microphones built in that are active when nothing is plugged in to the microphone input. If you leave the levels up and unplug the cable from the PCR1000, it could feedback and make an annoying whistle.

I hope this helps.

6271. PCR-1000 destroyed by TRX Manager... Help!

Yahoo group: PCR1000
Date: 2015-04-22 04:42:36 UTC
From: jimthescot989@...
Topic: 6271 Message: 6271

I downloaded the TRX Manger demo program on 4/10/2015. I installed same on my computer, running Win Vista. I attempted to connect to my trusty Icom PCR-1000 receiver as the software indicated that it does connect and control such Icom receiver. To my dismay, it did function somewhat, but I felt t I needed a better comparison between the ICOM software and TRX Manager. So I closed TRX Manager software. disconnected, launched the Icom software, only to find that the TRX Manager had trashed my PCR 1000 receiver: No Rx sensitivity, basically deaf, no (essentially so due to extremely low level) audio output!! No actions which I could take could remedy the situation . Basically, the TRX Manager software has destroyed my ICOM PCR 1000 receiver. Does anyone have any suggestions or similar experience?

6272. Re: [PCR1000] PCR-1000 destroyed by TRX Manager... Help!

Yahoo group: PCR1000
Date: 2015-05-03 17:09:46 UTC
From: Jay
Topic: 6271 Message: 6272

The author of TRX Manager probably is just sending data to the PCR-1000 as fast as he can, which is a bad thing as it tends to lock up the PCR and corrupt it's EEProm Memory...

One way to fix that would be to re-write the EEprom with known good values.

I believe that one of the programs in the File Section of this group has an eeprom file that can be used to fix that...

I downloaded the TRX Manger demo program on 4/10/2015. I installed same on my computer, running Win Vista. I attempted to connect to my trusty Icom PCR-1000 receiver as the software indicated that it does connect and control such Icom receiver. To my dismay, it did function somewhat, but I felt t I needed a better comparison between the ICOM software and TRX Manager. So I closed TRX Manager software. disconnected, launched the Icom software, only to find that the TRX Manager had trashed my PCR 1000 receiver: No Rx sensitivity, basically deaf, no (essentially so due to extremely low level) audio output!! No actions which I could take could remedy the situation . Basically, the TRX Manager software has destroyed my ICOM PCR 1000 receiver. Does anyone have any suggestions or similar experience?

Jay;
Thanks for the info. I have been conversing with the TRXManager
software author at length, and he is unable to duplicate the problem.
Therefore the situation is drifting rapidly toward WIndowsVista and the
Keyspan USB to RS-232 converter, and also corruption the PCR-1000.ini
file. I have more checking to accomplish and I will look at those files
you suggest. Thank you again,
Jim AF1MR

The author of TRX Manager probably is just sending data to the PCR-1000 as
fast as he can, which is a bad thing as it tends to lock up the PCR and
corrupt it's EEProm Memory...

One way to fix that would be to re-write the EEprom with known good values.

I believe that one of the programs in the File Section of this group has an
eeprom file that can be used to fix that...

What would be the correct set up to listen to port ops and VTS , I've tried scanning 157.000 to 162.00, useing. Mobile Discone Mag mount Also tried manual tune on VHF , do I use narrow or wide band , I get plenty of white noise but no audio . I know there was traffic because the man beside me was useing a VHF tx/rx Icom marine band radio .Soft ware installed Talk PCR and Icom PCR 1000 .
The only audio I have managed to pick up is Radio 2 . Is there any tests I can do to see if all is well . When I use the radio in the car where should the ground outlet go . Thank you David Wilson

Ch 16 is 156.800 MHz simplex world wide. Set up for narrow FM,25kHz spacing.
Channels in the UK tend to be more duplex than US, lookup a marine channel chart for your region.

If your radio is deaf, then the rom contents may be corrupt.

Hey all, I have a PCR1000 I haven't used for well over a year and was thinking of selling it. It comes complete with the ut-106.

What's the going rate for this unit and is anyone interested in making a sensible offer?

6286. Tracking Filter and Meteor scatter from GRAVES

Yahoo group: PCR1000
Date: 2015-06-30 15:18:10 UTC
From: mike.german@...
Topic: 6286 Message: 6286

OK then - own up if you can say anything about the tracking filter other than it tracks the RF frequency. I have started to look at using the PCR1000 again after a while of inactivity. I want to use it to monitor the GRAVE radar site near Dijon for meteors. I have had TalkPCR since it came out and even paid for it. Pete mahey knew (knows?) what he was talking about. The help manual says "The Tracking filter control, allows you to manually tune the RF front end of the radio." and a slider control allow me to do this.

Now, when I select the correct frequency for GRAVES and monitor the audio with a simple waterfall display I get all sorts of lines tracking across the page. Adjusting the slider drastically changes this audio signal and one setting gives a very acceptable signal for monitoring. Comparing things with an AR5000 running in parallel the results at this setting are very similar and a signal source identifies they are both on the same frequency..

I could take the view that it works so don't buck it - but I would like to be sure that the signal is not adulterated by the adjustment. So what has it done to the front end?

6287. Remotehams.com on Android

Yahoo group: PCR1000
Date: 2015-08-04 09:58:21 UTC
From: garymic3@...
Topic: 6287 Message: 6287

Just FYI, I have my PCR1000 on Remotehams.com using the HRD software and it works pretty well once it's set up.

I came back to this when I learned that they came out with a version on the client softwave to remote control the radio. I've been playing with it and it's not too shabby for a first edition. The PC based client and server software is free with no adware or other crap. The Android app is 10 bucks and worth the money in my opinion where I can now use my PCR radios anywhere with it!!

If you don't want to publish it for public use, you can simply use the "ORBserver" for unpublished internet remoting and just type in your ip address only inside the "ORBclient" on your android or PC to pull it up, adding you can also set it up to where only those you give permission from the server itself can access it to tune, play with the buttons and drop downs...

Type in "Remotehams" in Google Play to locate the app.. (Note: I have no vested interest in this!)

fordman_1701:
Now that you say you are using your Win10 tablet, there may beanother option available for your use:
For another simple (but powerful) program to try, I would suggestthat you look in the PCR1000 files section for a ZIP file namedPcrMC98.ZIP. It contains the latest version of the program that Iwrote a while ago. It is FREE, so please give it a try. If you like it,keep on using it. If not, nothing spent, nothing lost !! The weakestpart is the lack of a HELP file. Instead, I put all of my work intothe program itself, and did my best to make it self-explanatory. There are actually two executables included in this ZIPfile.
The first,PcrMC.exe is a DOS text-only version . . . it represents my originalprogram development. Much later in the development cycle, Idecided to implement the same capabilities in a DOS 640x480graphical version as PcrMC-SA.exe.
Both of these run very well under multiple versions of Windows(Win95, Win98, WinME, Win2K, WinXP). I have not personallytested it in Vista, but it runs great under Windows 7.
InWindows 7 & earlier versions, PcrMC.exe will run eitherfull-screen or in a DOS window.
Also in Windows 7 & earlierversions, PcrMC-SA.exe will only run full-screen (this is aWindows restriction, not a restriction of the program). InWindows 10, either program works GREAT as its own windowrunning under DOSBox 0.74(<https://sourceforge.net/projects/dosbox/>) !! Either executable can act as a very powerful scanner. In addition, thePcrMC-SA executable performs as a very good spectrum analyzer. The basic syntax to run the program is as follows: pcrmc[-sa] [-com1 | 2 | 3 | 4] [-fast] [-debug] [filename] Note that all command-line options are case-insensitive. [-com1 | 2 | 3 | 4] : you can specify the COM port on the command-line to override that which is recorded in the PCRMC.INI file. [-fast] : this will skip the pause on the "HELP" screen as the programis started up. [-debug] : this will cause a PCRMC.DBG file to be created that willcontain time-stamped entries for each command sent to the PCR-1000and each status returned from the PCR-1000. Note that when thereceiver is used as a scanner, this debug file can grow quite large intime !! Be aware of the disk-space requirements by running this fora long time. [filename] : you can specify the "program" file that you'd likePcrMC to initialize with upon startup (it is not necessary to also specifythe file extension as this is assumed to be .PGM). See some of theincluded "program" files for examples of how to make use of thepowerful capabilities within the PCR-1000 that Icom's includedWindows program woefully ignores and/or hides from us !! Good luck & let me know what you like/dislike. It's been quite awhile since I worked on it, but updates are not necessarily out of the question.
I definitely still use it all of the time. Even though it works especially well on very old (DOS-only) PCs (since that is what it was originally developed for), it works equally well under Windows (see above).
 A couple of notes that may prove very useful are as follows:
ALT-H shows a help screen (the closest thing there is to a HELP file !!)
ALT-A goes into "automatic" (demo) mode which will let you exercise
          all of the program features even without your PCR-1000 attachedALT-P starts/stops "program" modeALT-S starts/stops "scan" mode
ALT-Q quit without saving configuration
ALT-X exit & save current configuration

Pressing any of the selection keys (for example, O for mode) will cause that field to blink, indicating the selection that can be controlled using the up/down and/or left/right arrow keys to change the selection. Press the ENTER key to complete the selection for that field.

Frequency information can be entered anytime that no other fields are already active (pressing F first is not absolutely necessary). When entering frequency information, you can also use the backspace key to make corrections. As well, you can use the ESCAPE key prior to hitting the ENTER key in order to discard any frequency changes made and return to the previous frequency setting.

Some keys take effect immediately (typically those that alternate between two settings) such as G for AGC on/off, B for NB on/off, etc. Some keys have multiple functions (but with related control) such as P for bandscope...pressing P once will let you select the bandscope speed...pressing P again while the bandscope selection is active will change the bandscope vertical resolution multiplier.

Feel free to e-mail me if you have any questions, comments, and/or suggestions for improvements.

Have fun !!

Hi everyone! I lurked for years but now I have questions? I've resubscribed, searched the messages, and am now cutting to the chase.

I used my 1000 when my XP computer was new. Life got complicated and my 1000 got set aside. I'm retired now and I want to use my 1000 with my new Dell Win10 laptop. (I think I still have all my original 1000 software.)

What is the best control software and serial/usb adapter for Win10? Is anybody using a setup that is reliable and problem free? Any words of wisdom or advice?

I have memories of the time I spent with my 1000 that I'd like to revisit. Thanks.

Best regards,
Dave Lochhaas

Hi Dave,

best is always relative. But you could give RadioControl a try. It works on Windows 10, as well as
still on Windows 95. ;-)

http://www.radioctl.com/

As for the connection, the best solution is always to use a real serial port. The second best
solution is to use a USB/serial adapter having the FTDI chipset. These work best, not only on
Windows 10.

Best regards
Ralf Reiterer
RadioControl Developer

Hi Dave,

You can also check out these programs:
http://www.fiftyonefiftysystems.com/IComPcr.html

PCR Pro, TrunkPCR, PCR Remote and PCR Mini.
All run in Windows 95 through Windows 10 :-)

Regards,
Jay

Dave:
Sorry, I answered the "software" question earlier, but I forgot to include my comments on the "hardware" question as well:
I have been using the "Parallax USB to Serial (RS-232) Adapter" for many years in many different applications, both ham radio related and otherwise, and it has always been a strong & reliable player for me.
I would highly recommend this particular product for anyone looking for a USB-to-serial adapter that uses the FTDI chipset.
Without cable for $14.99:
   https://www.parallax.com/product/28030
With cable for $17.99:
   https://www.parallax.com/product/28031
Mark J CulrossKD5RXT
P.S. I have no pecuniary relationship with Parallax as a company other than "I send them money, & they send me stuff !!" MJC

I'm trying to get my PCR1000 running on a Raspberry Pi3 with Probe1K. I installed rpix86 with its associated 4DOS on the Raspberry but the DOS program crashes when I start Probe1K. I scan aviation frequencies and leave my current PC running Probe1K 24/7 and want to try to migrate to a Raspberry Pi and shutdown the PC in order to save some energy costs. Does anyone know of a way to run a PCR1000 on a Raspberry?

Thanks,
Gordon, NW7D

Dave about 6 months ago I started using my PCR1000. Now depending what you plan on using your pcr for, depends on what programming you need to consider.
I use mine strictly for HF listening. Depending on how I feel is what program I will use.
This is what I have installed;
PCR pro
Icom PCR1000 control software.
Free version of ham radio deluxe.
Shortwave log.
PCR Anywhere.

It depends on what you plan on using your radio for.
Plus one of the Yahoo PCR1000 groups has the full version of PCRBur program which I feel is a must. My PCR1000 eeprom was corrupted but the PCRBur program brought it back to life.

Sorry, what I hurriedly wrote didn't make as much sense as I intended.
1) I've used DOSBox 0.74 to run MS-DOS programs under Windows 10 with excellent results
2) I've run other MS-DOS programs successfully on my RPi3 using DOSBox
So, therefore:
3) I recommend that you try PcrMC.EXE or PcrMC-SA.EXE using DOSbox running on your Rpi3
Hopefully, this is clearer !!

ALT-Q quit without saving configuration
ALT-X exit & save current configuration
 Pressing any of the selection keys (for example, O for mode) will cause that field to blink, indicating the selection that can be controlled using the up/down and/or left/right arrow keys to change the selection. Press the ENTER key to complete the selection for that field.
 Frequency information can be entered anytime that no other fields are already active (pressing F first is not absolutely necessary). When entering frequency information, you can also use the backspace key to make corrections. As well, you can use the ESCAPE key prior to hitting the ENTER key in order to discard any frequency changes made and return to the previous frequency setting.
 Some keys take effect immediately (typically those that alternate between two settings) such as G for AGC on/off, B for NB on/off, etc. Some keys have multiple functions (but with related control) such as P for bandscope...pressing P once will let you select the bandscope speed...pressing P again while the bandscope selection is active will change the bandscope vertical resolution multiplier.
 Feel free to e-mail me if you have any questions, comments, and/or suggestions for improvements.
 Have fun !!

Gordon (NW7D):
Sorry, what I hurriedly wrote didn't make as much sense as I intended.
1) I've used DOSBox 0.74 to run MS-DOS programs under Windows 10 with excellent results
2) I've run other MS-DOS programs successfully on my RPi3 using DOSBox
So, therefore:
3) I recommend that you try PcrMC.EXE or PcrMC-SA.EXE using DOSbox running on your Rpi3
Hopefully, this is clearer !!

Subject: Re: [PCR1000] PCR 1000 on a Raspberry Pi3

  Gordon (NW7D):
For a simple (but powerful) program to try, I would suggestthat you look in the PCR1000 files section for a ZIP file namedPcrMC98.ZIP. It contains the latest version of the program that Iwrote a while ago. It is FREE, so please give it a try. If you like it,keep on using it. If not, nothing spent, nothing lost !! The weakestpart is the lack of a HELP file. Instead, I put all of my work intothe program itself, and did my best to make it self-explanatory. There are actually two executables included in this ZIPfile. The first,PcrMC.exe is a DOS text-only version . . . it represents my originalprogram development. Much later in the development cycle, Idecided to implement the same capabilities in a DOS 640x480graphical version as PcrMC-SA.exe.
Because Windows 10 no longe! r supports running MS-DOS programs directly,I've run other MS-DOS programs using DOSBox & had excellent luck.Both of these (PcrMC.EXE & PcrMC-SA.EXE) run GREAT under DOSBox 0.74(<https://sourceforge.net/projects/dosbox/>)
!! Either executable can act as a very powerful scanner. In addition, thePcrMC-SA executable performs as a very good spectrum analyzer. The basic syntax to run the program is as follows: pcrmc[-sa] [-com1 | 2 | 3 | 4] [-fast] [-debug] [filename] Note that all command-line options are case-insensitive. [-com1 | 2 | 3 | 4] : you can specify the COM port on the command-line to override that which is recorded in the PCRMC.INI file. [-fast] : this will skip the pause on the "HELP" screen as the programis started up. [-debug] : this will cause a PCRMC.DBG file to be created that willcontain time-stamped entries for each command sent to the PCR-1000and each status returned from the PCR-1000. Note that when thereceiver is used as a scanner, thi! s debug file can grow

quite large intime !! Be aware of the disk-space requirements by running this fora long time. [filename] : you can specify the "program" file that you'd likePcrMC to initialize with upon startup (it is not necessary to also specifythe file extension as this is assumed to be .PGM). See some of theincluded "program" files for examples of how to make use of thepowerful capabilities within the PCR-1000 that Icom's includedWindows program woefully ignores and/or hides from us !! Good luck & let me know what you like/dislike. It's been quite awhile
since I worked on it, but updates are not necessarily out of the question.
I definitely still use it all of the time. Even though it works especially
well on very old (DOS-only) PCs (since that is what it was originally
developed for), it works equally well under Windows (see above).
 A couple of notes that may prove very useful are as follows:
ALT-H shows a help screen (the closest thing there is to a HELP file !!)
ALT-A goes into "automatic" (demo) mode which will let you exercise
 &nbs! p;   all of the program features even without your PCR-1000 attachedALT-P starts/stops "program" modeALT-S starts/stops "scan" mode
ALT-Q quit without saving configuration
ALT-X exit & save current configuration
 Pressing any of the selection keys (for example, O for mode) will cause
that field to blink, indicating the selection that can be controlled using
the up/down and/or left/right arrow keys to change the selection. Press
the ENTER key to complete the selection for that field.
 Frequency information can be entered anytime that no other fields are
already active (pressing F first is not absolutely necessary). When
entering frequency information, you can also use the backspace key to
make corrections. As well, you can use the ESCAPE key prior to
hitting the ENTER key in order to discard any frequency changes made
and return to the previous frequency setting.

From: Dave Lochhaas
Topic: 6311 Message: 6322

Thanks for all the information and suggestions. I'm dusting off a 1000 that's been shelved for 12 years and I'm firing it up on a new and unfamiliar Windows 10 laptop. These software/hardware recommendations will help to get it up and running sooner rather than later, I hope.

My immediate goal is just to listen, play with some old antennas, try the different control software, drink a beer. I'll be starting over.
First things first, but later on I'll be changing my course to amateur radio astronomy. I've ordered the book, The Radio Sky and How to Observe It, by Jeff Lashley. I think there may be at least several radio telescope applications for the PCR1000 with the right antenna. This fits with another old hobby that I've also revived, telescope astronomy.

Best regards,

Dave Lochhaas

Hello,

After some years, my Icom PCR1000 is deffective.

When I turn it on, I can use the controls, change the frequencies, use the memories, etc, but the radio don´t receive any signals. The connection between the Icom and the computer works perfect, but no reception and no audio.

After 5 minutes, the radio starts to receive, but the audio is distorced. I did a test with FM Band, and the audio is really "treble" and I can´t understand the voices or music. In AM/SW band, the radio has a different problem: only scratches in some frequencies (like if the radio received in a short period and then, cut off), no audio even in local AM stations.

Did you have ideas about this problem?? Maybe capacitor?? Thanks so much (and sorry for my english).

Hi Evandro, there is a switch on the PCB (internal), SW1 which sometimes gets dirty and can affect the audio, it is the attenuator switch to reduce the audio at the speaker socket to line level.

Try giving it a few flicks.

Else if you are using an external speaker try moving the plug in the socket, these too get dirty and faulty.

Regards

Peter

Hi Evandro.

You write that both reception and audio is gone the first 5 minutes.

If you have a signal strenght meter in your software, it shows no
signal when you tune to a FM broadcast station?

If you have signal but no/bad audio then it is most likely as you suggested,
a bad capacitor in the audio circuit.

Open squelch in the FM band so you get noise in the speaker and set the pcr1000
volume to max for a couple of minutes and see what happens after that.

Hi Evandro,

Have you checked your power supply / adapter to be sure it's putting out a clean 12 to 13.8 volts D.C.?

When I bought my PCR-1000 back in 2000, it came with a power adapter that only had 10 volts output and that caused the very same thing...

Topic: 6331 Message: 6331

I have no experience with either a dysfunctional usb/serial adapter or a corrupted eeprom, I'm not sure how their symptoms compare, but I think one of them might be my problem.

I spent yesterday with my PCR1000 and never got a peep out of it. Ten years ago I used it fairly regularly for general listening running PCRTalk on an XL PC connected by an FTDI chipset usb/serial adapter.

Yesterday, I tried all combinations of the following several times:

New Dell Windows 10 laptop

PCR1000 connected to antenna and audio-out connected to an external powered speaker.

old FTDI chipset usb/serial adapter for which Win10 loaded the latest drivers.
old FTDI chipset usb/serial adapter with drivers rolled back to earlier version (as used by Parallax adapter).
new Insignia brand non-FTDI chipset usb/serial adapter with latest drivers.

IC-PCR1000 control software
PCR Pro control software

The results were the same in every case:

Low-level white noise that did not vary, from the speaker.
There was a pop in the speaker when the control software was turned off or on (in the software).
The signal meter never showed any indication of a signal.
Turning up the squelch showed on the signal meter but did not change the audio.
The software appeared functional.
I verified the eeprom in PCR Pro but don't know what that means.

I have a new Parallax (FTDI chipset) usb/serial adapter on order, just in case, and I could use to learn more about the PCRBur program, also, just in case.

Best regards,

Now with the stock Icom software if it powers the program up and does not show a error box then it is talking to the PCR.

If the EEPROM is corrupted it can be saved.

In this group file section is a program call PCRbur. Install that program and use it to restore the PCR.

If you have questions email me direct and I will walk you through it.

The Icom wall wart shows 16V and lots of 120Hz ripple no load.I have an early 1000 (s/n~2200), and all the Al capacitors around the780x regulators have died from the heat, and have been replaced. The other aging issue has been the drift of the 10.25MHz referenceVCXO. I am now at 247 out of 255 to get it to net on frequency.Distortion and dropout on NFM was the first symptom that there was
something wrong. I ran the set for more than 10 years 24/7 to get
to this point. A regulated supply is now in service, and I willtry some Chinese 10.25 crystals as a replacement.

Hello friends,

I read all the answer! Thanks for that.

I checked:
- Power Supply - it´s ok - 14,5V (when I connect to PCR the voltage down close to 12,55V) and I used an other one, professional model, with 13,8V;
- The connection (flat cables) between the two boards are ok;
- the sw1 switch it´s ok - the problem is that the signal it´s not present, so it´s not an audio problem, because when the radio starts to receive, the audio is present at the speaker connector or phone connector;
- I checked the voltages on the two regulators - 7805 is with 4.93V and the 7808 is with 7.9 V
- The scope only show some images when the radio receive signals (basically in FM);
- My version is the early ones;
- I´m using the Icom software (2.2 version);

I think that I have a problem in some component (or in a lot (capacitors)). Today I'll check some of them, but I haven't time, because I'll be on vacations next week, and I'll trip to US, so I only able to change them when I'll return in the end of May. But I'll post here any progress.

Thanks for now friends,

- Power Supply - it´s ok - 14,5V (when I connect to PCR the voltage down close to 12,55V) and I used an other one, professional model, with 13,8V;
- The connection (flat cables) between the two boards are ok;
- the sw1 switch it´s ok - the problem is that the signal it´s not present, so it´s not an audio problem, because when the radio starts to receive, the audio is present at the speaker connector or phone connector;
- I checked the voltages on the two regulators - 7805 is with 4.93V and the 7808 is with 7.9 V
- The scope only show some images when the radio receive signals (basically in FM);
- My version is the early ones;
- I´m using the Icom software (2.2 version);

I think that I have a problem in some component (or in a lot (capacitors)). Today I'll check some of them, but I haven't time, because I'll be on vacations next week, and I'll trip to US, so I only able to change them when I'll return in the end of May. But I'll post here any progress.

Thanks for now friends,

Evandro

I've had an exciting development.

My 1000 had seemed to have gone deaf after sitting on a shelf for ten years or so. I tried IC-PCR1000 and PCR Pro control software using my old FTDI chipset usb/serial adapter. No signals were detected but the software seemed to function correctly. I guessed either the usb/serial connector or a corrupted eeprom as the problem. However, both of these issues seemed, at least partially, ok and functional.
I checked an old backup external hard drive and found my old PCR Talk software that ran very well on my old XL desktop, now on blocks and missing parts. I ran the PCR Talk control software on my new Windows 10 laptop and guess what, long ago I had made a backup of my eeprom and it verified that my eeprom is still ok, no corruption. This indicated to me that the usb/serial adaptor was communicating correctly and that, indeed, my eeprom is fine. Yet, with the PCR Talk software I still could not find a signal, just like with the other control software.

I had just started looking for an internal PCR1000 hardware problem when the mail arrived and there was the usb/serial adapter that I had ordered from Parallax. So I loaded the driver and tried one more time to get the 1000 up and talking. As soon as I powered up PCR Pro, I was knocked out of my chair as my 1000 came up at full volume on my external powered speaker.

Everything works great now! I spent my Sunday trying control software and I did not encounter any failure. My thoughts are that it seems this Parallax adapter had something the others lacked though I don't know why my old non-Parallax, but with FTDI chipset, adapter quick working over these last ten years.

Thanks, Glenn, for suggesting (in a different thread) the usefulness of the Parallax adapter. Note the price has gone up and with the shipping it was $27, and worth it.

I have several questions from reading the archives. What is PCR Bur and how does it work? What are the contents of my eeprom, that is, what function of the 1000 uses the contents? It seems serial numbers are important in some way; My 1000's s/n is 0202358, what might this indicate? With IC-PCR1000 and PCR Pro should I be running in one of the compatibility modes in Windows 10 for either of these?
I'm so excited about this I'm not getting any of my chores done.

Thanks for any and all help and comments.

Best regards,
Dave Lochhaas

Now with the stock Icom software if it powers the program up and does not show a error box then it is talking to the PCR.

If the EEPROM is corrupted it can be saved.

In this group file section is a program call PCRbur. Install that program and use it to restore the PCR.

If you have questions email me direct and I will walk you through it.

Glenn

Subject: [PCR1000] Chasing my tail

I have no experience with either a dysfunctional usb/serial adapter or a corrupted eeprom, I'm not sure how their symptoms compare, but I think one of them might be my problem.

I spent yesterday with my PCR1000 and never got a peep out of it. Ten years ago I used it fairly regularly for general listening running PCRTalk on an XL PC connected by an FTDI chipset usb/serial adapter.

Yesterday, I tried all combinations of the following several times:

New Dell Windows 10 laptop

PCR1000 connected to antenna and audio-out connected to an external powered speaker.

old FTDI chipset usb/serial adapter for which Win10 loaded the latest drivers.
old FTDI chipset usb/serial adapter with drivers rolled back to earlier version (as used by Parallax adapter).
new Insignia brand non-FTDI chipset usb/serial adapter with latest drivers.

IC-PCR1000 control software
PCR Pro control software

The results were the same in every case:

Low-level white noise that did not vary, from the speaker.
There was a pop in the speaker when the control software was turned off or on (in the software).
The signal meter never showed any indication of a signal.
Turning up the squelch showed on the signal meter but did not change the audio.
The software appeared functional.
I verified the eeprom in PCR Pro but don't know what that means.

I have a new Parallax (FTDI chipset) usb/serial adapter on order, just in case, and I could use to learn more about the PCRBur program, also, just in case.

Best regards,
Dave Lochhaas

Since Win7 or so the older FTDI chips don't work. I forgot about that :-(

Yes sometimes. I do have a older radio shack model serial port adapter that works on windows 10 however it can be problematic. The only two I run are windows 10 compatible.
